Introduction

Welcome to **IELTS Academic Reading — Volume 4**, a printable practice book of 10 complete Reading tests, compiled and prepared by Teacher Ibodullaev Bekhruz.

Every test follows the real exam format: three passages of increasing difficulty and 40 questions covering the full range of IELTS question types — True/False/Not Given, Matching Headings, Matching Information, Multiple Choice, Summary and Sentence Completion, and more. Answer circles and blank lines are left for you to write your answers, just like on test day.

Part One contains all 10 tests with questions only, so you can practise without seeing any answers. **Part Two** contains the complete Answer Key for each test, with the keywords from each question and the exact sentence in the passage that proves the correct answer.

How to use this book:

- Sit each test in one go, under timed conditions — 60 minutes for all three passages.
- Write your answers directly in the circles and blanks provided.
- Check your answers in Part Two and read the passage evidence for every question you got wrong.
- Use the band-score table on the answer key pages to estimate your result, then revisit weak question types.

Good luck with your preparation, and follow **@bekhruzposts** for more free IELTS materials.

Reading Passage 1

When Maps Were Made for the Public

Since the art of map-making began, maps have largely been made for explorers, academics and rulers. It was not until the 19th century that the general public began to demand maps for themselves. More than anything else, it was the appeal of travel to ordinary people that encouraged publishing companies to begin creating and printing more maps than ever before, in order to meet the demand of their new market.

In the years after the American Civil War (1861–65), the rapidly growing US railroad system had so many independent rail companies, schedules and destinations that maps were critical for planning a person's journey. One publisher, Rand McNally, made a fortune from producing railways maps for different parts of the USA, combined with a timetable and many descriptions of scenery and towns in the same booklet.

When safety improvements in the 1880s helped to make the bicycle popular, cycling maps quickly followed. Trying to provide something special, publisher George Philip produced attractive-looking maps that would remain in good condition even if they were exposed to water. In 1896, one of the finest cycling maps was produced, in seven parts: George Blum's *Cyclers' Guide and Road Book of California*. Each cycle road was highlighted in red and labelled with not only the type of surface riders could expect to find, but also an indication of how steep it was.

The advent of the car brought a need for road maps and travel information. In 1900, André Michelin published a guide about France, with maps that showed the location of different kinds of reasonably priced accommodation and also car assistance for any mechanical problems. However, it was due primarily to its recommendations regarding which was the best restaurant to go to that the guide quickly became something that a huge number of tourists and travellers bought and relied on.

Nowhere was the need for road maps greater than in the United States. In 1902, the American Automobile Association was founded in Chicago, and three years later it published its first road maps for long-distance drivers. In 1917, Rand McNally began to publish *Auto Trails Maps*, a series of maps that each focussed in detail on a different region that people might hope to visit within North America. The same publisher also helped to establish the US's system of identifying its roads. Previously roads had names, following the European tradition, but now, thanks in part to Rand McNally, they were

allocated numbers instead. Also in the early twentieth century, publisher H. M. Gousha Company developed the *Touraide*, a set of spiral-bound maps with places to stay and eat and points of interest, ordered in advance and assembled individually for the traveller.

The oil companies did not take long to realize the profit to be made from Americans exploring the open road, so service stations soon began to distribute free maps to encourage this. Free road maps became part of the fabric of American life, and it has been estimated that more than ten billion were distributed before the 1970s. It was then that the rising costs of oil and subsequent falling consumption led to the oil companies investigating where savings could be made. The maps were one of the first things to go.

Another map product was the aeronautical chart for pilots. The first examples were produced in France and England around 1911. Techniques progressed greatly during World War 1, and during the 1920s there was continual development of maps for air navigation.

New maps also became available for those who only wanted to cross town by train. Some of the early maps of the London Underground were based on the city above ground; therefore, although they were accurate in terms of distance and direction, the maps were confusing because the stations in central London were so crowded together. In 1931, Harry Beck produced a map that looked rather like an electrical circuit, with straight lines and symbols. It included only one feature above ground: the river Thames. The stations were also spaced relatively equally, making the map much easier to read. Although Beck's map was initially rejected as too radical, it was approved in 1933. He continued to refine it for the next 25 years.

Shortly after Beck's contribution to the mapping of subterranean London, an equally significant achievement was performed above ground. Phyllis Pearsall was a painter who, in 1935, became lost on the way to a party in London, due to the lack of a good map. This inspired her to plot all of London, and the next year she traced and catalogued its 23,000 streets. With map-maker James Duncan, Pearsall then produced an atlas and a comprehensive street index. Unable to interest any of the major publishers, the two founded their own company, the Geographer's Map Company Ltd, and produced what was then called the *A–Z Atlas and Guide to London*. The company still exists and now publishes more than 300 different A–Z maps and atlases.

Questions 1–6

Complete the notes below. Choose **ONE WORD ONLY** *from the passage for each answer.*

The development of maps from the 19th century onwards

a growing interest in travel led to the increased production of maps in the 19th century

AFTER 1865

- Rand McNally made a lot of money by putting a map and a (1) _____ in one publication

AFTER 1880

- George Philip produced maps that could not be damaged by water
- George Blum's cycling map showed the kind of (2) _____ the paths had, and how steep the paths might be

1900 ONWARDS

- André Michelin's guide provided information about finding economical (3) _____, and what to do if your car broke down
- the Michelin guide became popular mainly because it helped people select a (4) _____

1917 ONWARDS

- the company's *Auto Trails Maps* helped people explore roads through a particular (5) _____ of the USA
- the company was also responsible for giving (6) _____ to American roads

Reading Passage 2

Preserving Antarctic History

Protecting early buildings in Antarctica

A Few people conjuring up the 'most comfortable dwelling place imaginable' are likely to picture a wooden shelter on an island off the coldest continent on Earth. But that's how Antarctic explorer Robert Falcon Scott described the hut at Cape Evans on Ross Island that was the base for his 1910–13 expedition. The hut is nestled below a small hill on a long stretch of black sand. In 2011, it looked like a building site, but now, seals lie on the ice in front of the newly restored structure and sun reflects off the cliffs of the nearby glacier.

B The New Zealand Antarctic Heritage Trust (NZAHT) and its team of conservation workers recently announced the completion of 10 years of intensive work to save three historic buildings on Ross Island. As well as the hut at Cape Evans, it has worked on the Discovery Hut from Scott's 1901–04 expedition at Hut Point, and the hut at Cape Royds, built for Ernest Shackleton's 1907–09 expedition. When work began, many of the artefacts were temporarily removed while carpenters from the team of conservation workers repaired the walls, floors and roof. In Scott's 'zone of command' was the table where team member Edward Wilson made his enduring biological and botanical illustrations. In a dark corner nearby, Edward Atkinson had once incubated his moulds and parasites. Of particular interest is the small workbench and array of test tubes, sample jars and Bunsen burner stands of biologist Edward Nelson, lit by sunshine through a dusty window. This was where the young scientist preserved marine specimens as part of his search for new species and an understanding of the Antarctic food chain.

C The NZAHT executive director Nigel Watson describes the three restored huts as 'fantastic remnants of humans' first contact with the continent'. The idea for the birth of the conservation project, he says, was the fact that we were in great danger of losing them. When the on-site work began in 2004, snow and ice were building up around, under and sometimes inside the huts, damaging the structures and threatening their contents. 'We now have three buildings that are structurally sound and watertight with a very different feel – they are drier and lighter and the humidity is reduced. It's a much better environment for the collection.'

D As well as heritage carpenters, the NZAHT team on Ross Island has included experts in textile, paper and metal conservation: in total, 62 experts from 11 countries have visited Antarctica to work on the project, often spending a whole summer on-site, sleeping in tents and popping 25km back to Scott Base for the occasional shower. 'It became known as the most exciting conservation project in the world,' says Watson, 'so it attracted top heritage conservation talent.'

Reviewed by @bekhruzposts

E Some of the most exciting discoveries were three intact crates of 'Mackinlay's Rare Old Highland Malt Whisky' found encased in ice beneath Shackleton's hut, a paper notebook that belonged to surgeon, zoologist and photographer George Murray Levick found buried in dirt at Cape Evans and a small box of 22 cellulose nitrate negatives waiting to be developed into photographs found in Herbert Ponting's darkroom. But most of the 18,202 items catalogued and conserved are more mundane: food, tools, clothing and other personal items that were not precious enough to be taken home on the return voyages.

F The NZAHT team's conservation treatments involved thorough cleaning, followed by chemical treatment to help slow, or even reverse, the deterioration. Metal items would go through corrosion removal, followed by a chemical stabilisation treatment, then application of an oxygen and moisture barrier to prevent further corrosion. Treatment of paper items often involved washing to remove harmful acids and salts and to help reinforce the fibres so that in some cases the paper was even stronger than before.

G As a result of the project, the NZAHT has become the world leader in cold-climate heritage conservation and its members have been interviewed for numerous television documentaries and radio reports. The Ross Island huts are the 'jewels in the crown', says Watson, but there are other historic buildings needing attention. With logistics support from *Antarctica New Zealand*, programme managers Al Fastier and Lizzie Meek will be part of a small team heading to Cape Adare, an exposed site more than 700km north of Scott Base. The two Cape Adare huts, remnants of an 1898–1900 British expedition, 'are not only the first buildings on the continent', says Watson, but also 'the only example of humanity's first buildings on any continent on Earth'.

H The three-year restoration effort will involve construction repairs and the removal, conservation and return of about 1100 objects. Compared with the hut sites on Ross Island, which are relatively sheltered, Cape Adare is 'a very remote and challenging place to work in', says Watson. It's set among the world's biggest colony of Adélie penguins on an exposed spit of land, and it is important that they don't interrupt the functioning of the colony in any way while they are there. Lizzie Meek looks forward to the challenge. 'But I'm also looking forward to going back to the Ross Island huts and seeing them with fresh eyes. After so many years of working on them, to be able to step inside and look around to see what we have accomplished will be amazing.'

I If you can find your way to Antarctica, you'll need a permit to visit any of these huts, which are each in an Antarctic Specially Protected Area. But there's an easier way to see them without making the long journey: the trust has partnered with Google to offer Street View walkthroughs of each of the dwellings, available via Google Earth or through the NZAHT's website.

Reading Passage 3

Flower Power

A Why do we give people flowers? To offer condolence to those who are grieving. To celebrate. To woo. To ask for forgiveness. We all know intuitively that there is something psychologically powerful about giving flowers; in fact, few objects provoke such a universal emotional response. In the US alone, the flower industry is now worth about $5bn a year – which suggests that, at the very least, they service a compelling human need.

B Recent studies at the Department of Psychology at Rutgers State University of New Jersey investigated claims that flowers are unique among living organisms in their ability to induce profound changes in our emotional state. As the first part of their research, the Rutgers team visited 150 women in their homes. Each was presented with a variety of gifts such as flowers, fruit or sweets. The women were unaware that the study was about the effect of the flowers on their emotions. They were told that it was a study about their daily moods, and that they would receive a gift in return for taking part. Following the presentation of the gift, those receiving flowers were assessed as displaying a much more positive mood than those who got other gifts, and this effect lasted for several days. After receiving flowers, they were also more willing to answer questions concerning their social circle and intimate conversations with friends and family. The results suggest that flowers influence our secondary socio-emotional behaviours, as well as having a strong effect on our immediate emotional expression.

C In the second study, the psychologists observed participants being handed single flowers, or alternative gifts, in a constrained and stressful situation – inside an elevator. Contrary to predictions regarding gender differences, both men and women presented with flowers were more likely to smile, to stand closer and to initiate conversation. Several subjects who were given the alternative gift then learnt that flowers were also being handed out, and returned to the elevator and demanded a flower. The scientists used elevators for this study precisely because the most typical behaviour in sparsely occupied elevators is for people to retreat to opposite corners. The subjects who received flowers, however, closed up that space to a considerable extent – indicating that the flowers not only induced a strong positive mood, but brought a significant affiliation among people who had never previously met.

D The third study involved regularly sending flowers to a selected sample of men and women. The researchers found not only a profound elevation of mood, but also reliable improvements in other measures of cognitive function, like memory. In this series of experiments, some participants produced such extraordinary emotional displays that the

Reviewed by @bekhruzposts

psychologists were totally unprepared for them. Subjects gave spontaneous hugs and kisses to the people who delivered the flowers, and sent invitations to the psychologists to come to their homes for refreshments.

E Various evolutionary hypotheses attempt to explain the remarkably powerful psychological effect of flowers. One is that our aesthetic preferences for fertile locations and growing things stem from prehistory, when these clues in our environment could mean the difference between starvation and survival. We may have become hardwired to respond positively to flowers because for early man, finding them in a particular location predicted future food supplies and possibly a better place to rear children. Yet the flaw in this argument is that showy flowers which humans seem to find most visually attractive are generally found on those plants which yield no edible products.

F The Rutgers psychologists' findings show that the various physical attributes of flowers combine to directly affect our emotions through multi-channel interactions. We have evolved preferences for the particular colours, textures, patterned symmetries and specific floral odours which influence our moods. Indeed, previous research has established that popular perfumes, which often have a floral 'top-note', will actually reduce depression. The origins of these inclinations may well be as the evolutionary theories suggest: the patterned symmetries of flowers can be detected easily as a recognisable signal within a wide variety of visual arrays, and a response to certain colour tones is important in finding ripe fruit against a leafy background. But, claim the Rutgers team, these preferences have long been separated from their primary evolutionary use, and become rewarding to us more generally. Thus plants with preferred colours, shapes and odours – despite having no other products – would therefore be protected and dispersed.

G The Rutgers study suggests that flowers may have actually evolved to exploit their peculiar impact on humans. The team's theory proposes a plant-human co-evolution, or even domestication, based on the intense emotional rewards that flowers provide. The idea that flowering plants, with no known food or other basic survival value to man, have co-evolved with us by exploiting an emotional niche instead, is very much like the scenario presented for the evolution of dogs. Flowers may be the plant equivalent of 'companion animals'. If this is true, then there is a very real sense in which, when you next give flowers, they are using you just as much as you are using them.

Reading Passage 1

The Last Man Who Knew Everything

In the 21st century, it would be quite impossible for even the most learned man to know everything. However, as recently as the 18th century, there were those whose knowledge encompassed most of the information available at that time. This is a review of a biography of one such man.

Thomas Young (1773–1829) contributed 63 articles to the great British encyclopaedia, *Encyclopaedia Britannica*, including 46 biographical entries (mostly on scientists and classical scholars), and substantial essays on 'Bridge' (a card game), 'Egypt', 'Languages' and 'Tides'. Was someone who could write authoritatively about so many subjects a genius, or a dilettante*? In an ambitious biography, Andrew Robinson argues that Young is a good contender to be described as 'the last man who knew everything'. Young has competition, however: the phrase which Robinson uses as the title of his biography of Young also serves as the subtitle of two other recent biographies: Leonard Warren's 1998 life of palaeontologist Joseph Leidy (1823–1891) and Paula Findlen's 2004 book on Athanasius Kircher (1602–1680).

Young, of course, did more than write encyclopaedia entries. He presented his first paper, on the human eye, to the prestigious academic institution, the Royal Society of London** at the age of 20 and was elected a Fellow of the Society shortly afterwards. In the paper, which seeks to explain how the eye focuses on objects at varying distances, Young hypothesised that this was achieved by changes in the shape of the lens. He also theorised that light travels in waves, and believed that, to be able to see in colour, there must be three receptors in the eye corresponding to the three 'principal colours' (red, green and violet) to which the retina could respond. All these hypotheses were subsequently proved to be correct. Later in his life, when he was in his forties, Young was instrumental in cracking the code that unlocked the unknown script on the Rosetta Stone, a tablet found in Egypt by the Napoleonic army in 1799. The stone has text in three alphabets: Greek, Egyptian hieroglyphs, and something originally unrecognisable. The unrecognisable script is now known as 'demotic' and, as Young deduced, is related directly to Egyptian hieroglyphs. His initial work on this appeared in the *Britannica* entry 'Egypt'. In another entry, Young coined the term 'Indo-European' to describe the family of languages spoken throughout most of Europe and northern India. These works are the landmark achievements of a man who was a child prodigy but who, unlike many remarkable children, did not fade into obscurity as an adult.

Reviewed by @bekhruzposts

Born in 1773 in Somerset in England, Young lived with his maternal grandfather from an early age. He devoured books from the age of two, and excelled at Latin, Greek, mathematics and natural philosophy (the 18th-century term for science). After leaving school, he was greatly encouraged by Richard Brocklesby, a physician and Fellow of the Royal Society. Following Brocklesby's lead, Young decided to pursue a career in medicine. He studied in London and then moved on to more formal education in Edinburgh, Göttingen and Cambridge. After completing his medical training at the University of Cambridge in 1808, Young set up practice as a physician in London and a few years later was appointed physician at St. George's Hospital.

Young's skill as a physician, however, did not equal his talent as a scholar of natural philosophy or linguistics. In 1801, he had been appointed to a professorship of natural philosophy at the Royal Institution, where he delivered as many as 60 lectures a year. His opinions were requested by civic and national authorities on matters such as the introduction of gas lighting to London streets and methods of ship construction. From 1819, he was superintendent of the Nautical Almanac and secretary to the Board of Longitude. Between 1816 and 1825, he contributed many entries to the *Encyclopaedia Britannica*, and throughout his career he authored numerous other essays, papers and books.

Young is a perfect subject for a biography – perfect, but daunting. Few men contributed so much to so many technical fields. Robinson's aim is to introduce non-scientists to Young's work and life. He succeeds, providing clear expositions of the technical material (especially that on optics and Egyptian hieroglyphs). Some readers of this book will, like Robinson, find Young's accomplishments impressive; others will see him as some historians have – as a dilettante. Yet despite the rich material presented in this book, readers will not end up knowing Young personally. We catch glimpses of a playful Young, doodling Greek and Latin phrases in his notes on medical lectures and translating the verses that a young lady had written on the walls of a summerhouse into Greek elegiacs. Young was introduced into elite society, attended the theatre and learned to dance and play the flute. In addition, he was an accomplished horseman. However, his personal life looks pale next to his vibrant career and studies.

Young married Eliza Maxwell in 1804, and according to Robinson, 'their marriage was happy and she appreciated his work'. Almost all we know about her is that she sustained her husband through some rancorous disputes about optics and that she worried about money when his medical career was slow to take off. Little evidence survives concerning the complexities of Young's relationships with his mother and father. Robinson does not credit them with shaping Young's extraordinary mind. Despite the lack of details concerning Young's relationships, however, anyone interested in what it means to be a genius should read this book.

Reading Passage 2

The Fashion Industry

A The fashion industry is a multibillion-dollar global enterprise devoted to the business of making and selling clothes. It encompasses all types of garments, from designer fashions to ordinary everyday clothing. Because data on the industry are typically reported for national economies, and expressed in terms of its many separate sectors, total figures for world production of textiles* and clothing are difficult to obtain. However, by any measure, the industry accounts for a significant share of world economic output.

B The fashion industry is a product of the modern age. Prior to the mid-19th century, virtually all clothing was handmade for individuals, either as home production or on order from dressmakers and tailors. By the beginning of the 20th century, with the development of new technologies such as the sewing machine, the development of the factory system of production, and the growth of department stores and other retail outlets, clothing had increasingly come to be mass-produced in standard sizes, and sold at fixed prices. Although the fashion industry developed first in Europe, today it is highly globalised, with garments often designed in one country, manufactured in another, and sold in a third. For example, an American fashion company might source fabric in China and have the clothes manufactured in Vietnam, finished in Italy, and shipped to a warehouse in the United States for distribution to retail outlets internationally.

C One of the first accomplishments of the Industrial Revolution in the 18th century was the partial automation of the spinning and weaving of wool, cotton, silk and other natural fibres. Today, these processes are highly automated and carried out by computer-controlled, high-speed machinery, and fabrics made from both natural fibres and synthetic fibres (such as nylon, acrylic, and polyester) are produced. A growing interest in sustainable fashion (or 'eco-fashion') has led to greater use of environmentally friendly fibres, such as hemp. In addition, high-tech synthetic fabrics confer such properties as moisture absorption, stain resistance, retention or dissipation of body heat, and protection against fire, weapons, cold, ultraviolet radiation, and other hazards. Fabrics are also produced with a wide range of visual effects through dyeing, weaving, printing, and other processes. Together with fashion forecasters, fabric manufacturers work well in advance of the clothing production cycle, to create fabrics with colours, textures, and other qualities that anticipate consumer demand.

D Historically, very few fashion designers have become famous brands such as Coco Chanel or Calvin Klein, who have been responsible for prestigious high-fashion collections. These designers are influential in the fashion world, but, contrary to popular belief, they do not dictate new fashions; rather, they endeavour to design clothes that will meet consumer

Reviewed by @bekhruzposts

demand. The vast majority of designers work in anonymity for manufacturers, as part of design teams, adapting designs into marketable garments for average consumers. They draw inspiration from a wide range of sources, including film and television costumes, street clothing, and active sportswear.

The fashion industry's traditional design methods, such as paper sketches and the draping of fabric on mannequins, have been supplemented or replaced by computer-assisted design techniques. These allow designers to rapidly make changes to a proposed design, and instantaneously share the proposed changes with colleagues – whether they are in the next room or on another continent.

E An important stage in garment production is the translation of the clothing design into templates, in a range of sizes, for cutting the cloth. Because the proportions of the human body change with increases or decreases in weight, templates cannot simply be scaled up or down. Template making was traditionally a highly skilled profession. Today, despite innovations in computer programming, designs in larger sizes are difficult to adjust for every body shape. Whatever the size, the template – whether drawn on paper or programmed as a set of computer instructions – determines how fabric is cut into the pieces that will be joined to make a garment. For all but the most expensive clothing, fabric cutting is accomplished by computer-guided knives or high-intensity lasers that can cut many layers of fabric at once.

F The next stage of production is the assembly process. Some companies use their own production facilities for some or all of the manufacturing process, but the majority rely on separately owned manufacturing firms or contractors to produce garments to their specifications. In the field of women's clothing, manufacturers typically produce several product lines a year, which they deliver to retailers on predetermined dates. Technological innovation, including the development of computer-guided machinery, has resulted in the automation of some stages of assembly. Nevertheless, the fundamental process of sewing remains labour-intensive. In the late 20th century, China emerged as the world's largest producer of clothing because of its low labour costs and highly disciplined workforce.

Assembled items then go through various processes collectively known as 'finishing'. These include the addition of decorative elements, fasteners, brand-name labels, and other labels (often legally required) specifying fibre content, laundry instructions, and country of manufacture. Finished items are then pressed and packed for shipment.

G For much of the period following World War II, trade in textiles and garments was strictly regulated by purchasing countries, which imposed quotas and tariffs. Since the 1980s, these protectionist measures, which were intended (ultimately without success) to prevent textile and clothing production from moving from high-wage to low-wage countries, have gradually been abandoned. They have been replaced by a free-trade

Reviewed by @bekhruzposts

approach, under the regulatory control of global organisations. The advent of metal shipping containers and relatively inexpensive air freight have also made it possible for production to be closely tied to market conditions, even across globe-spanning distances.

* textiles: varieties of cloth made from natural or man-made fibres

The development of a modern fashion industry

Up until the middle of the 19th century, people generally wore handmade clothes. After that the situation changed, and by the 20th century many clothes were mass produced. This development was partly due to inventions like the (21) ———————. It was also the result of general changes in manufacturing systems, as well as the spread of shops like (22) ———————. The changes also led to the standardisation of sizes and (23) ———————. Today, despite the fact that the fashion industry originated in (24) ———————, it has become a truly international enterprise.

Questions 25 and 26

Choose **TWO** *letters,* **A–E**. *Which* **TWO** *of the following statements does the writer make about garment assembly?*

(25)

(26)

A The majority of sewing is done by computer-operated machines.
B Highly skilled workers are the most important requirement.
C Most businesses use other companies to manufacture their products.
D Fasteners and labels are attached after the clothes have been made up.
E Manufacturers usually produce one range of women's clothing annually.

Reading Passage 3

How a Prehistoric Predator Took to the Skies

Is that a bird in the sky? A plane? No, it's a pterosaur. Kate Thomas meets Professor Matthew Wilkinson, who built a life-size model to find out how this prehistoric predator ever got off the ground.

Pterosaurs existed from the Triassic period, 220 million years ago, to the end of the Cretaceous period, 65 million years ago, when South America pulled away from Africa and the South Atlantic was formed. They are among the least understood of all the extinct reptiles that once spent their lives in the skies while the dinosaurs dominated the land. Pterosaurs had no feathers, but at least part of their bodies was covered in hair, not unlike bats. Some believe this is an indication they were warm-blooded. Researchers also debate whether pterosaurs travelled on the ground by walking on their hind legs, like birds, or by using all fours, relying on their three-toed front feet as well as their four-toed rear feet.

Pterosaurs were vertebrates, meaning they were the first species possessing backbones to become airborne, but scientists have never quite understood their flight technique. How, they wondered, did such a heavy creature ever manage to take off? How could a wing that appears to have been supported by fine, hollow bones have carried one into the sky? Then came the discovery of a site in Brazil's Araripe basin. Here, not only were hundreds of fossils of amphibians* and other reptiles found, but archaeologists unearthed a number of very well-preserved pterosaurs. The anhanguera – a fish-eating sub-species of pterosaur that ruled the skies in the Cretaceous period – was among them. With a wingspan of up to 12 metres, they would have made an amazing sight in the sky – had any human been there to witness it. 'I've been studying pterosaurs for about eight years now,' says Dr Matthew Wilkinson, a professor of zoology at Cambridge University. With an anhanguera fossil as his model, Wilkinson began gradually reconstructing its skeletal structure in his Cambridge studio. The probability of finding three-dimensional pterosaur fossils anywhere is slim. 'That was quite a find,' he says. 'Their bones are usually crushed to dust.' Once the structure was complete, it inspired him to make a robot version as a way to understand the animal's locomotion. With a team of model-makers, he has built a remote-controlled pterosaur in his studio. 'Fossils show just how large these creatures were. I've always been interested in how they managed to launch themselves, so I thought the real test would be to actually build one and fly it.'

Wilkinson hasn't been alone in his desire to recreate a prehistoric beast. Swiss scientists recently announced they had built an amphibious robot that could walk on land and swim in water using the sort of backbone movements that must have been employed by the first creatures to crawl from the sea. But Wilkinson had the added complication of working out his beast's flight technique. Unlike those of bats or flying squirrels, pterosaur wings – soft,

Reviewed by @bekhruzposts

stretchy membranes of skin tissue – are thought to have reached from the chest right to the ankle, reinforced by fibres that stiffened the wing and prevented tearing. Smaller subspecies flapped their wings during takeoff. That may have explained the creatures' flexibility, but it did not answer the most pressing question: how did such heavy animals manage to launch themselves into the sky? Working with researchers in London and Berlin, Wilkinson began to piece together the puzzle.

It emerged that the anhanguera had an elongated limb called the pteroid. It had previously been thought the pteroid pointed towards the shoulder of the creature and supported a soft forewing in front of the arm. But if that were the case, the forewing would have been too small and ineffectual for flight. However, to the surprise of many scientists, fossils from the Araripe basin showed the pteroid possibly faced the opposite way, creating a much greater forewing that would have caught the air, working in the same way as the flaps on the wings of an aeroplane. So, with both feet on the ground, the anhanguera might have simply faced into the wind, spread its wings and risen up into the sky. Initial trials in wind tunnels proved the point – models of pterosaurs with forward-facing pteroids were not only adept at gliding, but were agile flyers in spite of their size. 'This high-lift capability would have significantly reduced the minimum flight speed, allowing even the largest forms to take off without difficulty,' Wilkinson says. 'It would have enabled them to glide very slowly and may have been instrumental in the evolution of large size by the pterosaurs.'

Resting in the grass at the test site near Cambridge, the robot-model's wings ripple in the wind. In flight, the flexible membrane, while much stiffer than the real thing, allows for a smooth takeoff and landing. But the model has been troubled by other mechanical problems. 'Unlike an aircraft, which is stabilised by the tail wing at the back, the model is stabilised by its head, which means it can start spinning around. That's the most problematic bit as far as we're concerned,' Wilkinson says. 'We've had to take it flying without the head so far.' When it flies with its head attached, Wilkinson will finally have proved his point.

So what's next for the zoologist – perhaps a full-size Tyrannosaurus rex? 'No,' he tells me: 'We're desperate to build really big pterosaurs. I'm talking creatures with even greater wingspans, weighing a quarter of a ton. But,' he adds, just as one begins to fear for the safety and stress levels of pilots landing nearby at Cambridge City Airport, 'it's more likely we'll start off with one of the smaller, flapping pterosaurs.' This is certainly more reassuring. Let's hope he is content to leave it at that.

* amphibians: animals that can live both in water and on land

Questions 33–36

Do the following statements agree with the claims of the writer in the passage?

YES *if the statement agrees with the claims of the writer* • **NO** *if the statement contradicts the claims of the writer* • **NOT GIVEN** *if there is no information on this*

33 It is rare to find a fossil of a pterosaur that clearly shows its skeleton.

34 The reason for building the model was to prove pterosaurs flew for long distances.

35 It is possible that pterosaur species achieved their wing size as a result of the pteroid.

36 Wilkinson has made several unsuccessful replicas of the pterosaur's head.

Questions 37–40

Choose the correct letter, **A**, **B**, **C** *or* **D**.

37 What was Professor Wilkinson's main problem, according to the third paragraph?

A Early amphibians had a more complex structure than pterosaurs.
B Pterosaur wings could easily be damaged while on the ground.
C Flying squirrels and bats were better adapted to flying than pterosaurs.
D Large pterosaurs were not able to take off like other flying animals.

38 What did Professor Wilkinson discover about a bone in pterosaurs called a pteroid?

A It was in an unexpected position.
B It existed only in large species of pterosaurs.
C It allowed pterosaurs to glide rather than fly.
D It increased the speed pterosaurs could reach in the air.

39 According to the writer, the main problem with the remote-controlled 'pterosaur' is that

A it has been unable to leave the ground so far.
B it cannot be controlled when its head is attached.
C its wing material is not flexible enough.
D the force of the wind may affect its test results.

40 What does 'it' in the last sentence refer to?

A the information the tests have revealed
B Wilkinson's sense of achievement
C Wilkinson's desire to build models
D the comparison between types of models

IELTS Academic Reading — Test 3

Volume 4 · 3 Passages · 40 Questions

Reading Passage 1

Advertising Needs Attention

The harder advertisers try to get your attention, the more your brain ignores them

Jane Raymond, a consumer psychologist at the University of Wales in Bangor, is carefully holding and gazing at a bottle of Chillz mineral water like a baby. Despite being made of clear plastic, it looks as if it has been carved from ice. This simple feature means shoppers are drawn to this bottle over the others on the shelf and cannot resist picking it up, Raymond says. She studies the subtle factors that motivate us to buy what we buy, and advise big companies on how powerful an advertisement is, and how it could be designed to stick more firmly in a consumer's memory. Most of all she works out how to attract your attention.

In today's fast-paced consumer world, attention is in short supply. Whether we are taking our time shopping in a mall, surfing the internet for information, or just watching television as a form of passive entertainment, consumers are surrounded by messages – experiencing one every 15 seconds of our waking lives, according to some estimates. Last year, companies worldwide spent $401 billion on advertising, according to the independent World Advertising Research Centre in the UK. But as the graveyard of failed products shows, they usually get it wrong.

Nine out of 10 new products meet an early death, says Jamie Rayner, director of research at ID Magasin, a UK consultancy specializing in consumer behavior. And the reason, he explains, is simple: conventional advertising has ceased to work. Rayner and his colleagues have measured how consumers, in particular regular commuters, react to advertising, and their conclusion should alarm many executives. They used a camera embedded in a pair of glasses to record their gaze as they glanced at advertisements on their journey to and from work. After analyzing the recordings and questioning the subjects, they found that most of the advertisements made no impression at all: only about one per cent could be recalled without prompting. It seems that although we may be looking at brands and advertisements all day long, most of the time we're not taking anything in.

Raymond thinks she knows why. Her move from research in visual processing into consumer psychology began in the early 1990s, when she discovered some strange behavior in the brain's attentional system. She showed people a stream of letters and numbers on a screen and asked them to look out for a white letter or an X. When she asked

@bekhruzposts
Reviewed by @bekhruzposts

her volunteers afterwards what they had seen, she found that if the X appeared up to half a second or so after the white letter, or vice versa, people failed to see it. She concluded that if something catches your attention, your brain is blind to anything else for a short period afterwards. She called this effect the 'attentional blink'. In short, the reason most advertising doesn't work is that we're in a severe state of attentional overload. Unless advertising is presented in a way the brain can absorb, it is simply not seen, Raymond says.

So what does this mean for advertisers? A typical television advertisement consists of a series of attention-grabbing images interspersed with the product. But unless the scenes in the advertisement are cut to take account of attentional blink. The brain is likely to ignore the information the advertiser wants to get across. The same applies to magazine advertisements, where viewers often register the main image but fail to pick up on the secondary images – the bits advertisers often desperately want us to see. Raymond says advertisers consistently fail to consider how easily the brain misses the point. It's not that they haven't realized that the space and time they have to get their message across has shrunk. But advertisers respond by cramming in ever more complex information. Raymond is opposed to this and her advise is simple: deliver your message in a straightforward manner and do so slowly, gently and concisely.

After her research on the attentional blink, she wondered whether attention would be linked to other processes in the brain, particularly emotion. Could our attentional state influence whether we like or dislike a brand, for example? Today, companies are hugely interested in the emotional value of their brand as they want their products to make us feel good. It is well known that if something elicits positive emotions then you are more likely to take notice of it. But Raymond's further research also demonstrated that if people are distracted by an image or a brand when performing an intellectually demanding task they tend to instantly dislike the brands, regardless of its emotional value. So for example, if you are reading a web page when a banner advertisement starts flashing, or are watching a film with intrusive product placement, it is probable you will come to dislike the brand whatever it is.

This contradicts the more-exposure-the-better rule most of the industry follows, says Raymond and means that advertising can backfire horribly. Advertisers tend to buy as much exposure for a product as they can, through television and radio commercials, billboards, whatever they think will attract their target audience, but again Raymond has found that this doesn't necessarily work in their favor. Perhaps the most dangerous time, says Raymond, is the holiday season when advertisers are madly competing to grab people's attention. 'Marketers don't realize that humans digest information like they do food. Once they are full, if they are shown any more food, they're disgust,' she says.

Questions 1–7

Do the following statements agree with the information given in the passage?

TRUE *if the statement agrees with the information* • **FALSE** *if the statement contradicts the information* • **NOT GIVEN** *if there is no information on this*

1 Jane Raymond stated that Chillz mineral water is packaged in a way that is unattractive to consumers.

2 Consumers are still exposed to more advertising through television commercials than through the medium of the internet.

3 According to Jamie Rayner, the reason that most products are discontinued is that advertising fails to attract consumers.

4 Jamie Rayner shows that people are no longer influenced by traditional advertisements.

5 Jamie Rayner believed that commercials should be simpler in their content.

6 Advertisements showing unfamiliar brands affect a person's concentration more than ones with familiar brands.

7 Jane Raymond suggests that a product should be advertised in as many ways as possible.

Reading Passage 2

Growing More for Less

Satellite technology is helping farmers boost crop yields

A For farmers, working out the optimal amount of seed, fertiliser, pesticide and water to scatter on a field can make, or break, the subsequent harvest. Regular laboratory analyses of soil and plant samples from various parts of the field can help – but such expertise is costly, and often unavailable. However, a new and cheaper method of doing this analysis is now on offer. Precise prescriptions for growing crops can be obtained quickly, and less expensively, by calculating the amount of electron-magnetic radiation reflected from agricultural land. The data is collected by orbiting satellites.

B Examining the wavelength of the radiation that is reflected can reveal, with surprising precision, the properties of the soil, the quantity of crop being grown, and the levels in those crops of chlorophyll, various mineral, moisture and other indicators of their quality. If recent and forecast weather data is added to the mix, detailed maps can be produced indicating exactly how, where and when crops should be grown. The service usually costs less than US $15 per hectare for a handful of readings a year, and can increase yields by as much as 10%.

C Such precision farming using satellite-based intelligence is a relatively new technique. Even so, it is catching on quickly. Five times a year, for example, a French cereal-growers' co-operative called Sevepi purchases satellite data and makes it available to its members in the form of maps of their fields, divided into three of four colour-coded zones per hectare. For each zone, one of about 50 fertilizer formulas is recommended. On top of this, if the wheat in the field has already grown quite high early in the season, and heavy showers are expected, an appropriate dose of growth regulator is recommended for each zone. (Lone, fragile stems break more easily in downpours.) Then, farm vehicles equipped with global-positioning system locators automatically mix and apply the prescribed dose to each area.

D France is the pioneer in this sort of surveillance. More farmland is analysed by satellite there than in any other country, according to Infoterra (a subsidiary of EADS Astrium), the firm that is France's largest provider of such information, supplying data to companies such as Sevepi. Moreover, Henri Douche, head of Infoterra's agriculture sales in Toulouse, reckons the amount of monitored farmland will increase as weather patters change and farmers can no longer rely on the past as a guide to the future. When confounded by the yield variations that these new weather patterns will bring, even farmers who are afraid of new technology will sign up, he says.

Reviewed by @bekhruzposts

E Inexpensive date on the productivity of land is advantageous to governments, too. Areas where fertillisers and pesticides are being applied excessively can be pinpointed, studied and regulated by environmental and land-use agenices. Guy Lafond, an agronomist with Agriculture and Agri-food Canada, a government agency, says the satellite date it purchases is providing useful for the study of fields with declining productivity in the province of Saskatchewan. Overkill with nitrate fertilizers (which are also a source of greenhouse gases) appears partly responsible. And according to RapidEye, a German statellite operator, insurance companies are also studying satellite data with a view to selling insurance policies to governments of famine-prone countries that might be threatened by crop failure.

F In March, RapidEye began selling data that helps forecast harvest. 'Too often, farmers limit productivity by managing fields uniformly,' says Fredrick Jung-Rothenhausler, head of product development at the firm's headquarters in Brandenburg an der Havel. 'Our satellites are the first commercial satellites to include the Red-Edge band of the light spectrum, which is sensitive to changes in chlorophyll content. More research will be necessary to realise the full potential of the Red-Edge band. However, this band can assist in monitoring vegetation health, improving species separation and also help in measuring protein and nitrogen content in biomass.' The company's date, which comes from both Europe and the Americas, breaks field productively down into patches just five metres square.

G The advantage that satellite technology provides in terms of precision farming do not have to be restricted to rich countries. In Africa, where many soils have become badly depleted of nutrients, better fertiliser management would greatly improve the situation. As a consequence, the charitable trust World Agroforestry Centre, in the city of Nairobi, in Kenya, has begun to build up a catalogue of the radiation patterns derived from around 100,000 samples of African soils. The information is the key to understanding the potential of these soils to be more agriculturally productive. Once passed on to the International Center for Tropical Agriculture, based in Colombia, South America, it is intended that the information be used to build a database called the 'Digital Soil Map'. When ready, this will provide farmers with free forecasts, developed with regularly updated satellite imagery, across farmland in a number of countries in Africa. This is information which will almost certainly assist in improving crop yield. For a hunger-ravaged continent, that is good news indeed.

Reading Passage 3

The Fluoridation Controversy

The long-standing debate about whether to fluoridate our drinking water continues

Fluoridation is the addition of fluorine to public water supplies with the aim of reducing tooth decay. The fluorine, when mixed with water, becomes fluoride and the desired concentration of fluoride in public water is approximately one part per million, depending on the regional temperature and hence the amount of water people are likely to drink. Many studies, such as those by McClure in 1970 through to Burt in 1983, have shown that when children drink fluoridated water, their average rate of tooth decay seems greatly reduced. A typical figure claimed is 50 percent reduction. This apparently enormous benefit for children's teeth is the major argument in favor of fluoridation.

Three main grounds for opposition to fluoridation have been expressed. First, opponents claim the benefits are exaggerated or not established. Second, there are claims of health risks to parts of the population, for example, allergic reactions. It is also accepted that high levels of fluoride can cause discoloration of otherwise healthy teeth. Proponents do not consider this to be a problem in such small concentrations, whereas opponents disagree – especially because some people drink more water and obtain much more than the standard 1 milligram of fluoride per day. Third, fluoridation is thought to be an infringement on individual rights because it is compulsory medication of all members of a community.

An understanding of the fluoridation issue has important implications. If, according to the experts, fluoridation is unquestionably a beneficial and non-hazardous measure, then the wisdom of allowing the public to vote on, and reject it must be questioned.

Almost all studies that have been done have assumed that the scientific aspects of the controversy are unproblematic, and they have excluded science from sociological examination. The traditional view is that science is a special kind of knowledge, which is established through scientific methods and objectively applied by members of a scientific community. However, in recent years there has been a major challenge to this picture by a sociology of science that shows how scientific knowledge is socially negotiated, and inevitably linked to the values of the relevant parties, both scientists and nonscientists. These challengers do not see scientific knowledge as exempt from social inquiry.

Kuhn (1970) argued that scientific knowledge does not always develop as an orderly process, but is characterized by periodic revolutions, in which the methods of study and the assessment criteria change in a fragmented way. According to Kuhn, the shift from one scientific way of thinking to another is not made solely on the basis of clear rules of formal scientific practice, but can include social factors, though Kuhn has never developed a full analysis of what these might be. Collins (1975) took this concept further when he asserted

Reviewed by @bekhruzposts

that the outcome of experiments was not something whose meaning could be immediately comprehended, but rather something for interpretation, discussion between scientists, and reinterpretation in the light of other experiments.

One interpretation of this analysis of science is that traditional distinctions between facts and theories, and between scientific knowledge and values, can no longer be justified. Because social processes are involved at all stages of the creation, evaluation, and establishing of scientific knowledge, social values may also be involved.

In the same way as many scientists who study fluoridation have overlooked social values, sociologists have also downplayed an important part of the debate by ignoring the number of eminent scientists who have questioned aspects of fluoridation. An example is the study by Sutton in 1960, which analyzed the classic North American studies of the effect of fluoridation on tooth decay, and found that each showed significant methodological shortcomings. Sutton's detailed study throws doubt as to the extent of reductions in tooth decay from fluoridation. Yet Sutton's book is not cited in a single analysis of the fluoridation issue by any sociologist.

In a situation of some scientific uncertainty, differences in values are highlighted. A supporter of fluoridation might argue, 'The evidence for the benefits of fluoridation is quite substantial, while the evidence for harm is limited and dubious. I think the likely benefits outweigh the possible dangers; hence I support fluoridation because it is the cheapest and easiest way to make sure every child reaps the benefits.' An opponent might argue, 'Though the evidence for the benefits of fluoridation is substantial, there is some doubt about it. Since fluoridation is not necessary for good teeth, we should forego the benefits if there is some slight chance of harm. Some scientists claim that a small percentage of the population could be harmed by fluoride. Therefore, I oppose fluoridation of water supplies and favor the voluntary use of fluoride tablets by those who want to take them.'

Both arguments consider the scientific evidence concerning fluoridation, but differ in their assessments of the social benefits and costs. This difference is not between rationality and irrationality but is a legitimate difference in values, for example, the positive value placed on good teeth, the negative value placed on possible health risks, and the social benefits or costs of compulsory or voluntary intake of fluorides.

From the sociological point of view, opposition to fluoridation is not necessarily irrational. Rather, claims to rationality and to scientific authority are better seen as part of a strategy to promote fluoridation than as incontrovertible statements of fact. Second, social values are likely to be bound up in any decision about fluoridation, so this is not an issue on which declarations by scientific experts ought to be considered the final word.

Questions 27–31

Choose the correct letter, **A**, **B**, **C** *or* **D**.

27 The optimum amount of fluorine in fluoridated water is calculated partly according to

A how hot the area is.

B how warm the water is.

C how many dental problems there are in the community.

D how much fluorine the community chooses to have in its water.

28 One reason given by the writer for opposing fluoridation is that

A it may contribute to tooth decay.

B it will be unacceptably expensive for the public.

C obligatory fluoridation takes away personal freedom.

D excessive fluoride could be added to the water by mistake.

29 The writer mentions Kuhn in order to

A provide a contrast with the view of Collins.

B support the rational nature of scientific inquiry.

C demonstrate that Kuhn did not argue his case adequately.

D show that science can be influenced by non-scientific considerations.

30 What did Sutton's research discover about earlier studies in North America?

A There were failings in the way they were carried out.

B The scientists involved had achieved unique results.

C Proponents of fluoridation had not understood its long-term effects.

D Fluoridation had a greater effect on tooth decay than previously believed.

31 In the last paragraph, what does the writer say about scientists?

A They should reveal their true motivations.

B They should not decide the fluoridation policy.

C They are solely concerned with scientific truths.

D They cannot reach agreement on the fluoridation issue.

Questions 32–35

Do the following statements agree with the views of the writer in the passage?

YES *if the statement agrees with the views of the writer* • **NO** *if the statement contradicts the views of the writer* • **NOT GIVEN** *if there is no information on this*

32 Scientific knowledge should be kept separate from social values.

33 Many sociologists have disregarded the doubts that some scientists have concerning fluoridation.

34 Sutton's findings have been given insufficient attention by scientists outside of North America.

35 There are valid arguments on both sides of the fluoridation debate.

Questions 36–40

Complete each sentence with the correct ending, **A–G**, *below.*

SENTENCE ENDINGS

A the results of scientific research are not always understood at first.
B science is an unbiased discipline.
C people should be able to choose whether they want fluoride.
D there is insufficient proof to support a cautious approach.
E the serious damage fluoride causes far outweighs any positive effects.
F children are not the only ones who benefit from fluoridation.
G scientific knowledge is affected by the beliefs of everyone concerned.

36 The traditional view of science is that ____

37 A sociological view of science argues that ____

38 Collins is of the opinion that ____

39 The writer suggests that a supporter of fluoridation may conclude that ____

40 The writer suggests that an opponent of fluoridation may conclude that ____

Reading Passage 1

Multiple Intelligences

The implications of multiple intelligence theory for teachers

The first intelligence test was developed in France by Alfred Binet early in the 20th century. By the 1920s and 1930s, intelligence tests and their product, an individual's IQ (Intelligence Quotient), had become widely used in many societies around the world. Tests of this type, however, have now fallen into disrepute. All they test is linguistic and logical-mathematical intelligence and this traditional definition of intelligence is now regarded as too narrow. We now know that 75% of teachers are sequential, analytical presenters but 70% of students do not actually learn this way. A number of investigators now believe that the mind consists of several independent modules or intelligences. The educational psychologist most responsible for this change of attitude is Howard Gardner, professor of education at Harvard University in the United States and the creator of the Multiple Intelligence theory.

Multiple Intelligence theory, according to Gardner, is an endorsement of three key propositions: we are not all the same, we do not all have the same kinds of minds, and education works most effectively if these differences are taken into account. Gardner argues that there are at least eight kinds of intelligence that are important to fuller human development and that are available for almost everyone to develop. These intelligences are:

1. Linguistic intelligence
2. Logical-mathematical intelligence
3. Musical intelligence
4. Spatial intelligence
5. Bodily-kinesthetic intelligence
6. Interpersonal intelligence
7. Intrapersonal intelligence
8. Naturalist intelligence

Gardner also speculates on the possibility of there being both a spiritual intelligence and an existential intelligence but comes to no definite conclusions.

Following are some characteristics of the different intelligences, along with ways to exercise and develop them:

Reviewed by @bekhruzposts

Linguistic intelligence: Involves reading, writing, speaking, and conversing in one's own or foreign languages. It may be exercised through reading interesting books, listening to recordings, using various kinds of computer technology, and actively participating in discussions.

Logical-mathematical intelligence: Involves number and computing skills, developing an awareness of patterns, and the ability to solve different kinds of problems through logic. It may be exercised through playing number and logic games, and solving various kinds of puzzles.

Musical intelligence: Involves understanding and expressing oneself through music and rhythmic movements or dance. It may be exercised through exposure to a variety of recordings, engaging in rhythmic activities, and singing, dancing, or playing various instruments.

Spatial intelligence: Involves the ability to create and manipulate mental images, and the orientation of the body in space. It may be developed through sharpening observation skills, solving mazes and other spatial tasks, and using imagery and active imagination.

Bodily-kinesthetic intelligence: Involves understanding how to communicate with and understand other people and how to work collaboratively. It may be exercised through cooperative games, group projects and discussions, and dramatic activities or role-playing.

Intrapersonal intelligence: Involves comprehending our emotions, and growing in the ability to control and work with them consciously. It may be exercised through participating in independent projects, journal-writing, and finding quiet places for reflection.

Applying Multiple Intelligence theory to the classroom

Gardner proposes that the eight intelligences he has identified are independent, in that they develop at different times and to different degrees in different individuals. They are, however, closely related, and many teachers and parents are finding that when an individual develops proficiency in one area, the whole constellation of intelligences may be enhanced.

Gardner refers to intelligences as potentials that will or will not be activated, depending upon the values of a particular society, and the personal decisions made by individuals and/or their families. A student who believes that intelligence can be developed is likely to be persistent and adventurous. However, learner who thinks they have no control over their ability level is more likely to get upset when faced with failure, as it can only be constructed as evidence of inadequate ability. The fluid theory of intelligence advocated by Gardner encourages students to stretch themselves.

Reviewed by @bekhruzposts

Does the fact that we each have a unique profile mean that teachers should plan individual lessons for every student in the class to take this into account? Clearly, this would be impractical and the solution lies in including classroom activities designed to appeal to each of the intelligence types.

Gardner suggests that the challenge of the coming decades is to stop treating everyone in a uniform way. He proposes individually configured education – an education that takes individual differences seriously and creates practices that serve different kinds of minds equally well.

Questions 1–4

Do the following statements agree with the information given in Reading Passage 1?

TRUE *if the statement agrees with the information* • **FALSE** *if the statement contradicts the information* • **NOT GIVEN** *if there is no information on this*

1 Intelligence tests became popular worldwide in the early 20th century.

2 Traditional intelligence tests focused on assessing language and mathematical ability.

3 New types of intelligence tests have now been developed to assess the potential of schoolchildren.

4 Research has shown that the majority of students benefit when information is taught in a sequential manner.

Reading Passage 2

A Unique Golden Textile

A two-man project to use spider silk is achieved after 4 years

A A rare textile made from the silk of more than a million wild spiders has been on display at the American Museum of Natural History in New York City. To produce this golden cloth, 70 people spent four years collecting golden orb spiders from telephone poles in Madagascar, while another dozen workers carefully extracted about 80 feet of silk filament from each of the arachnids. The resulting 11-foot by 4-foot textile is the only large piece of cloth made from natural spider silk existing in the world today.

B Spider silk is very elastic and strong compared with steel or Kevlar, said textile expert Simon Peers, who co-led the project. Kevlar is a lightweight synthetic fabric which is chemically related to nylon. It is very tough and durable and used in bullet-proof vests. Kevlar is also resistant to wear, tear, and heat and has absolutely no melting point. But the tensile strength of spider silk is even greater than Kevlar's aramid filaments, and greater than that of high-grade steel. Most importantly, spider silk is extremely lightweight: a strand of spider silk long enough to circle the Earth would weigh less than 500 grams (18 oz). Spider silk is also especially ductile, able to stretch up to 140 per cent of its length without breaking. It can hold its strength below -40C. This gives it a very high toughness, which equals that of commercial fibers.

C Researchers have long been intrigued by the unique properties of spider silk. Unfortunately, spider silk is extremely hard to mass produce. Unlike silk worms, which are easy to raise in captivity, spiders have a habit of chomping off each other's heads when housed together. According to Peers, there's scientific research going on all over the world right now trying to replicate the tensile properties of spider silk and apply it to all sorts of areas in medicine and industry, but no one up until now has succeeded in replicating 100 per cent of the properties of natural spider silk.

D Peers came up with the idea of weaving spider silk after learning about the French missionary Jacob Paul Camboue, who worked with spiders in Madagascar during the 1880s and 1890s. Camboue built a small, hand-driven machine to extract silk from up to 24 spiders at once, without harming them. The spiders were temporarily restrained, their silk extracted, and then let go. Peers managed to build a replica of this 24-spider silking machine that was used at the turn of the century, said Nicholas Godley, who co-led the project with Peers. As an experiment, the pair collected an initial batch of about 20 spiders. 'When we stuck them in the machine and started turning it, lo and behold, this beautiful gold-colored silk started coming out', Godley said.

Reviewed by @bekhruzposts

E But to make a textile of any significant size, the silk experts had to drastically scale up their plan. Fourteen thousand spiders yield about an ounce of silk, Godley said, and the textile weighs about 2.6 pounds. The numbers are overwhelming. To get as much silk as they needed, Godley and Peers began hiring dozens of spider handlers to collect wild arachnids and carefully harness them to the silk-extraction machine. 'We had to find people who were willing to work with spiders,' Godley said, 'because they bite.' By the end of the project, Godley and Peers extracted silk from more than 1 million female golden orb spiders, which are abundant throughout Madagascar and known for the rich golden color of their silk. Because the spiders only produce silk during the rainy season, workers collected all the spiders between October and June. Then an additional 12 people used hand-powered machines to extract the silk and weave it into 96-filament thread. Once the spiders had been silked, they were released back into the wild, where Godley said it takes them about a week to regenerate their silk. 'We can go back and re-silk the same spiders,' he said. 'It's like the gift that never stops giving.'

F Of course, spending four years to produce a single textile of spider silk isn't very practical for scientists trying to study the properties of spider silk, or companies that want to manufacture the fabric for the use as a biomedical product, or an alternative to Kevlar armor. Several groups have tried inserting spider genes into bacteria or even cows and goats to produce silk, but so far, the attempts have been only moderately successful. Part of the reason it's so hard to generate spider silk in the lab is that it starts out as a liquid protein that's produced by a special gland in the spider's abdomen. Using their spinneret, spiders apply force to rearrange the protein's molecular structure and transform it into solid silk. When we talk about a spider spinning silk, we're talking about how the spider applies forces to produce a transformation from liquid to solid, said spider silk expert Todd Blackledge of the University of Akron, Ohio, US, who was not involved in creating the textile. Scientists simply can't replicate the efficiency with which a spider produces silk. Every year we're getting closer and closer to being able to mass-produce it, but we're not there yet. For now, it seems we'll have to be content with one incredibly beautiful cloth, graciously provided by more than a million spiders.

Reading Passage 3

The Power of Persuasion

A New Zealand restaurateur assesses some recent research from the USA

Some scientists peer at things through high-powered telescopes, others tempt rats through mazes, or mix bubbling fluids in glass beakers. Then there is Robert Cialdini, whose unorthodox research involves such mundane items as towels and chocolates. Nonetheless, Cialdini believes he is discovering important insights into how society works, because he is conducting research into why some people are more persuasive than others.

Cialdini hopes that, by applying a little science, we should all be able to get our own way more often. This is in part a personal quest with its origins in his own experience: Cialdini claims that for his whole life he has been easy prey for salespeople and fundraisers who have managed to persuade him to buy things he did not want or give to charities he had never heard of.

Experiments on the psychology of persuasion were telling only a part of the story, Cialdini began to probe influence in the real world, enrolling in sales-training programmes. In this way, he believes he learned firsthand a great deal about how to sell automobiles from a car lot, insurance from an office, and even encyclopaedias door to door. Most recently his research has involved the now famous experiments with towels. Many hotels leave a little card in each bathroom asking guests to reuse towels and thus conserve water and reduce pollution. Cialdini and his colleagues wanted to test the relative effectiveness of different text on those cards. Could hotels best motivate their guests to co-operate simply because it would help save the planet, or were other factors more compelling?

To test this, the researchers redesigned the cards, replacing the environmental message with the simple (and truthful) statement that the majority of guests at the hotel had reused their towel at least once. Those guests who received this message were found to be 26% more likely to reuse their towel than those given the original message, and 74% more likely than those receiving no message at all.

This was just one study that has enabled Cialdini to identify his Six Principles of Persuasion. The phenomenon revealed by the towel experiment he calls 'social proof': the idea that our decisions are influenced by what other people like us are doing. More perniciously, social proof is the force underpinning some people's anxiety not to be left behind by their neighbours, thus the desire for a bigger house or a faster car. A further principle, which he names 'reciprocity', was tested in a restaurant by measuring how patrons would respond to after-dinner chocolates. When the chocolates were dropped

Reviewed by @bekhruzposts

individually in front of each diner, tips went up 14%. This is reciprocity in action: we want to return favours done to us, often without bothering to accurately calculate whether what we are giving is proportionate to what we have received.

Cialdini's research has established four more such principles. 'Scarcity' is the idea that people want more of things they can have less of, a notion that advertisers ruthlessly exploit – limit of four per customer. Parents can also make use of scarcity by telling their little ones that this is a very unusual chance so they should seize it immediately. The principle of 'authority' states that we trust people who know what they are talking about. Cialdini maintains that many professionals don't display their credentials, fearing it is boastful or arrogant to publicise their expertise. The principle he labels 'consistency' suggests that we want to act in ways that are consistent with undertakings we have already made. For example, if you are soliciting charitable donations, first ask colleagues if they think they will sponsor you. Later, return with a sponsorship form to those who said yes and remind them of their earlier undertaking. The final principle is 'likeness': we are more easily persuaded by those who seem similar to ourselves. In one study, people were sent survey forms and asked to return them to a named researcher. When the researcher falsely identified herself (e.g. Cynthia Johnson is sent a survey by Cindy Johansen), surveys were twice as likely to be completed.

Many of Cialdini's claims about persuasion are just that – highly persuasive – and I can readily see evidence for some of them in my own workplace. But Cialdini's experiments were conducted in the United States and I wonder how well all of his findings can be applied here in New Zealand or elsewhere around the world. For instance, I do understand the general principle of 'reciprocity' but cannot imagine New Zealand waiting staff using his cynical chocolate trick in their restaurants because the culture of tipping in this country is so different. But it is true that the way to a diner's heart is to give them something they are not expecting in the way of service and in this country reciprocation would more likely take the form of a return visit to the restaurant and not a tip. It may be that age is also a factor and that different generations would react differently to say, the 'consistency' principle. I suspect that younger people in this country would respond quite positively to this sort of approach, whereas their parents might be put off by any hint of a hard sell. Perhaps in the end we must accept that some of us are simply born with more persuasion skills than others and that we have less control over such matters than Cialdini might like to think.

Questions 27–31

Choose the correct letter, **A**, **B**, **C** *or* **D**.

27 What point is the writer making about Robert Cialdini in the first paragraph?

A He wants to change the way society operates.
B He uses a wide variety of research techniques.
C He has an unconventional approach to his work.
D He refuses to make use of animals in his experiments.

28 What is the writer doing in the second paragraph?

A identifying a motivation for the research
B assessing an aspect of Cialdini's character
C questioning Cialdini's scientific research techniques
D applauding researchers who examine their own experience

29 What are we told about Cialdini's research methodology?

A it was conducted in a laboratory
B it involved him taking courses of study
C it was focused on one particular product
D it was based on interviews with salespeople

30 What was Cialdini's research question for the towel experiment?

A Is it more effective not to use a card?
B Does the message make any difference?
C Why is the threat of pollution so persuasive?
D Can hotels be persuaded to provide more towels?

31 The results of the towel experiment suggest that guests

A were disinclined to tell the truth about towel use
B preferred not to receive a message with their towels
C were more receptive to messages about other guests
D responded more positively to an environmental message

Volume 4 · 3 Passages · 40 Questions

Reading Passage 1

Classifying Societies

Although humans have established many types of societies throughout history, sociologists and anthropologists tend to classify different societies according to the degree to which different groups within a society have unequal access to advantages such as resources, prestige or power, and usually refer to four basic types of societies. From least to most socially complex they are clans, tribes, chiefdoms and states.

Clan – These are small-scale societies of hunters and gatherers, generally of fewer than 100 people, who move seasonally to exploit wild (undomesticated) food resources. Most surviving hunter-gatherer groups are of this kind, such as the Hadza of Tanzania or the San of southern Africa. Clan members are generally kinsfolk, related by descent or marriage. Clans lack formal leaders, so there are no marked economic differences or disparities in status among their members.

Because clans are composed of mobile groups of hunter-gatherers, their sites consist mainly of seasonally occupied camps, and other smaller and more specialised sites. Among the latter are kill or butchery sites – locations where large mammals are killed and sometimes butchered – and work sites, where tools are made or other specific activities carried out. The base camp of such a group may give evidence of rather insubstantial dwellings or temporary shelters, along with the debris of residential occupation.

Tribe – These are generally larger than mobile hunter-gatherer groups, but rarely number more than a few thousand, and their diet or subsistence is based largely on cultivated plants and domesticated animals. Typically, they have settled farmers, but they may be nomadic with a very different, mobile economy based on the intensive exploitation of livestock. These are generally multi-community societies, with the individual communities integrated into the larger society through kinship ties. Although some tribes have officials and even a 'capital' or seat of government, such officials lack the economic base necessary for effective use of power.

The typical settlement pattern for tribes is one of settled agricultural homesteads or villages. Characteristically, no one settlement dominates any of the others in the region. Instead, the archaeologist finds evidence for isolated, permanently occupied houses or for permanent villages. Such villages may be made up of a collection of free-standing houses,

Reviewed by @bekhruzposts

like those of the first farms of the Danube valley in Europe. Or they may be clusters of buildings grouped together, for example, the pueblos of the American Southwest, and the early farming village or the small town of Catalhoyuk in modern Turkey.

Chiefdom – These operate on the principle of ranking – differences in social status between people. Different lineages (a lineage is a group claiming descent from a common ancestor) are graded on a scale of prestige, and the senior lineage, and hence the society as a whole, is governed by a chief. Prestige and rank are determined by how closely related one is to the chief, and there is no true stratification into classes. The role of the chief is crucial.

Often, there is local specialisation in craft products, and surpluses of these and of foodstuffs are periodically paid as an obligation to the chief. He uses these to maintain his retainers and may use them for redistribution to his subjects. The chiefdom generally has a center of power, often with temples, residences of the chief and his retainers, and craft specialists. Chiefdoms vary greatly in size, but the range is generally between about 5000 and 20,000 persons.

Early State – These preserve many of the features of chiefdoms, but the ruler (perhaps a king or sometimes a queen) has explicit authority to establish laws and also to enforce them by the use of a standing army. Society no longer depends totally upon kin relationships: it is now stratified into different classes. Agricultural workers and the poorer urban dwellers form the lowest classes, with the craft specialists above, and the priests and kinsfolk of the ruler higher still. The functions of the ruler are often separated from those of the priest: the palace is distinguished from the temple. The society is viewed as a territory owned by the ruling lineage and populated by tenants who have an obligation to pay taxes. The central capital houses a bureaucratic administration of officials; one of their principal purposes is to collect revenue (often in the form of taxes and tolls) and distribute it to government, army and craft specialists. Many early states developed complex redistribution systems to support these essential services.

This rather simple social typology, set out by Elman Service and elaborated by William Sanders and Joseph Marino, can be criticised, and it should not be used unthinkingly. Nevertheless, if we are seeking to talk about early societies, we must use words and hence concepts to do so. Service's categories provide a good framework to help organise our thoughts.

Reading Passage 2

Corporate Social Responsibility

Broadly speaking, proponents of CSR have used four arguments to make their case: moral obligation, sustainability, license to operate, and reputation. The moral appeal – arguing that companies have a duty to be good citizens and to 'do the right thing' – is prominent in the goal of Business for Social Responsibility, the leading nonprofit CSR business association in the United States. It asks that its members 'achieve commercial success in ways that honour ethical values and respect people, communities, and the natural environment.' Sustainability emphasises environmental and community stewardship.

A An excellent definition was developed in the 1980s by Norwegian Prime Minister Gro Harlen Brundtland and used by the World Business Council for Sustainable Development: 'Meeting the needs of the present without compromising the ability of future generations to meet their own needs.' Nowadays, governments and companies need to account for the social consequences of their actions. As a result, corporate social responsibility (CSR) has become a priority for business leaders around the world. When a well-run business applies its vast resources and expertise to social problems that it understands and in which it has a stake, it can have a greater impact than any other organization. The notion of license to operate derives from the fact that every company needs tacit or explicit permission from governments, communities, and numerous other stakeholders to justify CSR initiatives to improve a company's image, strengthen its brand, enliven morale and even raise the value of its stock.

B To advance CSR, we must root it in a broad understanding of the interrelationship between a corporation and society. Successful corporations need a healthy society. Education, health care, and equal opportunity are essential to a productive workforce. Safe products and working conditions not only attract customers but lower the internal costs of accidents. Efficient utilization of land, water, energy, and other natural resources makes business more productive. Good government, the rule of law, and property rights are essential for efficiency and innovation. Strong regulatory standards protect both consumers and competitive companies from exploitation. Ultimately, a healthy society creates expanding demand for business, as more human needs are met and aspirations grow. Any business that pursues its ends at the expense of the society in which it operates will find its success to be illusory and ultimately temporary. At the same time, a healthy society needs successful companies. No social program can rival the business sector when it comes to creating the jobs, wealth, and innovation that improve standards of living and social conditions over time.

Reviewed by @bekhruzposts

C A company's impact on society also changes over time, as social standards evolve and science progresses. Asbestos, now understood as a serious health risk, was thought to be safe in the early 1900s, given the scientific knowledge then available. Evidence of its risks gradually mounted for more than 50 years before any company was held liable for the harms it can cause. Many firms that failed to anticipate the consequences of this evolving body of research have been bankrupted by the results. No longer can companies be content to monitor only the obvious social impacts of today. Without a careful process for identifying evolving social effects of tomorrow, firms may risk their very survival.

D No business can solve all of society's problems or bear the cost of doing so. Instead, each company must select issues that intersect with its particular business. Other social agendas are best left to those companies in other industries, NGOs, or government institutions that are better positioned to address them. The essential test that should guide CSR is not whether a cause is worthy but whether it presents an opportunity to create shared value – that is, a meaningful benefit for society that is also valuable to the business. Each company can identify the particular set of societal problems that it is best equipped to help resolve and from which it can gain the greatest competitive benefit.

E The best corporate citizenship initiatives involve far more than writing a check: They specify clear, measurable goals and track results over time. A good example is General Electronics's program to adopt under-performing public high schools near several of its major U.S. facilities. The company contributes between $250,000 and $1 million over a five-year period to each school and makes in-kind donations as well. GE managers and employees take an active role by working with school administrators to assess needs and mentor or tutor students. In an independent study of 10 schools in the program between 1989 and 1999, nearly all showed significant improvement, while the graduation rate in four of the five worst-performing schools doubled from an average of 30% to 60%. Effective corporate citizenship initiatives such as this one create goodwill and improve relations with local governments and other important constituencies. What's more, GE's employees feel great pride in their participation. Their effect is inherently limited, however. No matter how beneficial the program is, it remains incidental to the company's business, and the direct effect on GE's recruiting and retention is modest.

F Microsoft's Working Connections partnership with the American Association of Community Colleges (AACC) is a good example of a shared-value opportunity arising from investments in context. The shortage of information technology workers is a significant constraint on Microsoft's growth; currently, there are more than 450,000 unfilled IT positions in the United States alone. Community colleges, with an enrollment of 11.6 million students, representing 45% of all U.S. undergraduates, could be a major solution. Microsoft recognizes, however, that community colleges face special challenges: IT curricula are not standardized, technology used in classrooms is often outdated, and there

Reviewed by @bekhruzposts

are no systematic professional development programs to keep faculty up to date. Microsoft's $50 million five-year initiative was aimed at all three problems. In addition to contributing money and products, Microsoft sent employee volunteers to colleges to assess needs, contribute to curriculum development, and create faculty development institutes. Microsoft has achieved results that have benefited many communities while having a direct–and potentially significant–impact on the company.

G At the heart of any strategy is a unique value proposition: A set of needs a company can meet for its chosen customers that others cannot. The most strategic CSR occurs when a company adds a social dimension to its value proposition, making social impact integral to the overall strategy. Consider Whole Foods Market, whose value proposition is to sell organic, natural, and healthy food products to customers who are passionate about food and the environment. The company's sourcing emphasizes purchases from local farmers through each store's procurement process. Buyers screen out foods containing any of nearly 100 common ingredients that the company considers unhealthy or environmentally damaging. The same standards apply to products made internally. Whole Foods' commitment to natural and environmentally friendly operating practices extends well beyond sourcing. Stores are constructed using a minimum of virgin raw materials. Recently, the company purchased renewable wind energy credits equal to 100% of its electricity use in all of its stores and facilities, the only Fortune 500 company to offset its electricity consumption entirely. Spoiled produce and biodegradable waste are trucked to regional centers for composting. Whole Foods' vehicles are being converted to run on biofuels. Even the cleaning products used in its stores are environmentally friendly. And through its philanthropy, the company has created the Animal Compassion Foundation to develop more natural and humane ways of raising farm animals. In short, nearly every aspect of the company's value chain reinforces the social dimensions of its value proposition, distinguishing Whole Foods from its competitors.

Reading Passage 3

Amateur Naturalists

From the results of an annual Alaskan betting contest to sightings of migratory birds, ecologists are using a wealth of unusual data to predict the impact of climate change

A Tim Sparks slides a small leather-bound notebook out of an envelope. The book's yellowing pages contain bee-keeping notes made between 1941 and 1969 by the late Walter Coates of Kilworth, Leicestershire. He adds it to his growing pile of local journals, birdwatchers' lists and gardening diaries. 'We're uncovering about one major new record each month,' he says, 'I still get surprised.' Around two centuries before Coates, Robert Marsham, a landowner from Norfolk in the east of England, began recording the life cycles of plants and animals on his estate – when the first wood anemones flowered, the dates on which the oaks burst into leaf and the rooks began nesting. Successive Marshams continued compiling these notes for 211 years.

B Today, such records are being put to uses that their authors could not possibly have expected. These data sets, and others like them, are proving invaluable to ecologists interested in the timing of biological events, or phenology. By combining the records with climate data, researchers can reveal how, for example, changes in temperature affect the arrival of spring, allowing ecologists to make improved predictions about the impact of climate change. A small band of researchers is combing through hundreds of years of records taken by thousands of amateur naturalists. And more systematic projects have also started up, producing an overwhelming response. 'The amount of interest is almost frightening,' says Sparks, a climate researcher at the Centre for Ecology and Hydrology in Monks Wood, Cambridgeshire.

C Sparks first became aware of the army of 'closet phenologists', as he describes them, when a retiring colleague gave him the Marsham records. He now spends much of his time following leads from one historical data set to another. As news of his quest spreads, people tip him off to other historical records, and more amateur phenologists come out of their closets. The British devotion to recording and collecting makes his job easier – one man from Kent sent him 30 years' worth of kitchen calendars, on which he had noted the date that his neighbour's magnolia tree flowered.

D Other researchers have unearthed data from equally odd sources. Rafe Sagarin, an ecologist at Stanford University in California, recently studied records of a betting contest in which participants attempt to guess the exact time at which a specially erected wooden tripod will fall through the surface of a thawing river. The competition has taken place annually on the Tenana River in Alaska since 1917, and analysis of the results showed that the thaw now arrives five days earlier than it did when the contest began.

Reviewed by @bekhruzposts

E Overall, such records have helped to show that, compared with 20 years ago, a raft of natural events now occur earlier across much of the northern hemisphere, from the opening of leaves to the return of birds from migration and the emergence of butterflies from hibernation. The data can also hint at how nature will change in the future. Together with models of climate change, amateurs' records could help guide conservation. Terry Root, an ecologist at the University of Michigan in Ann Arbor, has collected birdwatchers' counts of wildfowl taken between 1955 and 1996 on seasonal ponds in the American Midwest and combined them with climate data and models of future warming. Her analysis shows that the increased droughts that the models predict could halve the breeding populations at the ponds. 'The number of waterfowl in North America will most probably drop significantly with global warming,' she says.

F But not all professionals are happy to use amateur data. 'A lot of scientists won't touch them, they say they're too full of problems,' says Root. Because different observers can have different ideas of what constitutes, for example, an open snowdrop. 'The biggest concern with ad hoc observations is how carefully and systematically they were taken,' says Mark Schwartz of the University of Wisconsin, Milwaukee, who studies the interactions between plants and climate. 'We need to know pretty precisely what a person's been observing – if they just say 'I noted when the leaves came out', it might not be that useful.' Measuring the onset of autumn can be particularly problematic because deciding when leaves change colour is a more subjective process than noting when they appear.

G Overall, most phenologists are positive about the contribution that amateurs can make. 'They get at the raw power of science: careful observation of the natural world,' says Sagarin. But the professionals also acknowledge the need for careful quality control. Root, for example, tries to gauge the quality of an amateur archive by interviewing its collector. 'You always have to worry – things as trivial as vacations can affect measurement. I disregard a lot of records because they're not rigorous enough,' she says. Others suggest that the right statistics can iron out some of the problems with amateur data. Together with colleagues at Wageningen University in the Netherlands, environmental scientist Arnold van Vliet is developing statistical techniques to account for the uncertainty in amateur phenological data. With the enthusiasm of amateur phenologists evident from past records, professional researchers are now trying to create standardised recording schemes for future efforts. They hope that well-designed studies will generate a volume of observations large enough to drown out the idiosyncrasies of individual recorders. The data are cheap to collect, and can provide breadth in space, time and range of species. 'It's very difficult to collect data on a large geographical scale without enlisting an army of observers,' says Root.

Reviewed by @bekhruzposts

H Phenology also helps to drive home messages about climate change. 'Because the public understand these records, they accept them,' says Sparks. It can also illustrate potentially unpleasant consequences, he adds, such as the finding that more rat infestations are reported to local councils in warmer years. And getting people involved is great for public relations. 'People are thrilled to think that the data they've been collecting as a hobby can be used for something scientific – it empowers them,' says Root.

Questions 27–33

Reading Passage 3 has eight paragraphs, **A–H**. *Which paragraph contains the following information?*

Q	Information	Paragraph
27	The definition of phenology	
28	How Sparks first became aware of amateur records	
29	How people reacted to their involvement in data collection	
30	The necessity to encourage amateur data collection	
31	A description of using amateur records to make predictions	
32	Records of a competition providing clues to climate change	
33	A description of a very old record compiled by generations of amateur naturalists	

Questions 34–36

Complete the sentences below. Choose **NO MORE THAN TWO WORDS** *from the passage for each answer.*

Walter Coates's records largely contain the information of (34) _____.

Robert Marsham is famous for recording the (35) _____ of animals and plants on his land.

According to some phenologists, global warming may cause the number of waterfowl in North America to drop significantly due to increased (36) _____.

Questions 37–40

Choose the correct letter, **A**, **B**, **C** *or* **D**.

37 Why do a lot of scientists discredit the data collected by amateurs?

A Scientific methods were not used in data collection.

B Amateur observers are not careful in recording their data.

C Amateur data is not reliable.

D Amateur data is produced by wrong candidates.

38 Mark Schwartz used the example of leaves to illustrate that

A amateur records can't be used.

B amateur records are always unsystematic.

C the colour change of leaves is hard to observe.

D valuable information is often precise.

39 How do the scientists suggest amateur data should be used?

A Using improved methods

B Being more careful in observation

C Using raw materials

D Applying statistical techniques in data collection

40 What's the implication of phenology for ordinary people?

A It empowers the public.

B It promotes public relations.

C It warns people of animal infestation.

D It raises awareness about climate change in the public.

Reading Passage 1

Building a Castle

Guédelon is no ordinary building site. There is no rumble of diggers or shriek of circular saws. All is peaceful and quiet, save for the continual tapping of the small army of stonemasons, the quacking of the ducks or the occasional crow of the cockerel. Slowly but surely, a brand new medieval castle is rising from the woods of Guédelon, Yonne, home to the Burgundy vineyards in the heart of France. The year is 1229 – that is, for the purposes of this project: to build a prince's 'château fort' using only the techniques and tools of the 13th century.

'The project has four main aims,' explains Macyline Martin, managing director for Guédelon. 'The first is experimental archaeology – to try and verify all the theories, based on documents of the time. There's also a social aim, because this region is very poor, with high unemployment: so it provides jobs. Then there's tourism: the project couldn't work without visitors because a lot of money is needed to pay people working here and to run the site. And finally, we want to open experimental archaeology to everybody – because in France, history and architecture are still very much oriented to academics.'

The idea for the project emerged about five years ago. It was the brainchild of Michel Guyot, who bought and renovated the nearby castle of Saint-Fargeau, which was built and rebuilt between the 10th and 18th centuries. Beneath his castle were the original foundations of the 13th-century building. Guyot thought it would be fun to construct a château to the same plans, but this proved too big to attempt. So Jacques Moulin, managing director for the local historical monuments, drew up plans for a smaller castle that would still be ambitious, but realistic. Five months later, having managed to get together 600,000 Euros in funding, they began looking for a site that would provide all the materials they needed: stone, water, sand, wood, iron and clay. They found it at Guédelon.

The only major cheat so far was early on when a mechanical earthmover was brought in to raise the castle floor. Archaeologists know how it was done in the 13th century: by backbreaking, tedious work. 'To do it by hand would have added ten years to the project,' says Franck, one of the site's guides. It's still a long, painstaking task. Next to the beginnings of the east wall is the quarry, where masons extract the ferruginous limestone to build the thick castle walls. They bore lines of holes into the rocks and then they hammer metal wedges into them until the rock splits along the line. It is then hewn into

Reviewed by @bekhruzposts

bricks, and cemented together with a mortar of chalk, sand and quicklime. Quicklime is made by heating limestone to 800°C – done off-site because of the poisonous gases that come from the process. Little wonder that 13th-century lime-burners had a life expectancy of only 25-30 years. 'The bricks are laid horizontally for the first metre of the wall, and vertically thereafter,' says Franck, 'because if there was a shock from, say, a catapult, and the stones were all laid in the same way, the shockwave would shatter the wall.'

The scientists and craftspeople alike are learning on the job, as they don't know exactly why or how things were done as the historical evidence suggests. One such discovery was the significance of the marks that masons carved into each finished stone. It was thought that these probably had superstitious meaning, but experience and archaeological research reveals three very practical uses: to establish how much each mason should be paid; to keep track of who made what, in case of any problems; and to specify where the stone should be placed in the castle reconstruction.

Guédelon has a scientific committee of archaeologists that discusses ideas and problems as they emerge, and will approve works and practices only when its members are sure that they are true to the 13th century. Reaching unanimity is not always easy. 'All the big plans for the castle itself are done but the details aren't settled,' says Martin. 'So, during the winter, the site manager and I visit other castles in the region. When we see something we want to do here, we draw a sketch, make plans and show this to the committee.'

The castle will take at least a decade longer to build than it would have in the 13th century. 'With the same number of workers it would have taken 15 years then,' says Franck. 'But we could do this too if we had only professional workers, if the site wasn't open to the public and if we worked harder – today it's illegal to work more than 8 hours a day, as they did at the time.'

Workers come and go but at any one time about 40 people are working on the site. Some are students, others have 'downshifted' from other careers, others are local unemployed people learning skills they might use elsewhere – say, in château restorations around France. They are trained on the site as the need arises, and in the winter they may be trained in modern techniques as part of Guédelon's social remit.

So, indeed, what will happen when Guédelon's magical-looking castle is complete? They might build houses around it; perhaps villages may develop, testing out 13th-century agricultural techniques. If they can build this castle, anything seems possible.

Reading Passage 2

A Study of Western Celebrity

In our celebrity-obsessed culture, TV shows, internet blogs, and even newspapers are often full of the latest news, gossip and scandals about current celebrities

A It seems that our current society cannot get enough information about the daily lives of celebrities. But how did celebrities become so much an important force in our culture? While people have always had shared a certain obsession for the fantastic and the famous, the notion of celebrity, as well as the types of people termed 'celebrities', has evolved greatly throughout the ages. The word 'celebrity' has its roots in the language of the ancient Roman civilization. The word we now know to mean 'a condition of being famous' or 'a famous person' is derived from the Latin word 'celeber', meaning 'frequented or populous'.

B The celebrities of the ancient world were the powerful and awesome deities of Greece and Rome, and the citizens of these civilizations believed in a vast number of immortals who had a direct impact on their lives. It was, therefore, important to know about these figures' personal lives. This need to know led to the creation of myths, which personalized the gods and involved them in ancient celebrity scandals that thrilled and excited the common people.

C During ancient times, amateur and professional athletes also began to make an impact on the celebrity culture. Victors in the ancient Olympic Games were treated as heroes and were often elevated to god-like status. In the ancient Roman civilization, gladiators – the equivalent of today's professional athletes – were also revered by the common people for their heroics and seemingly superhuman strength.

D As Europe moved into the Dark Ages (the years spanning approximately 400-1300 AD) and a time when athletics and the arts were largely forgotten, monarchs and rulers continued to maintain celebrity status, while religious figures took on newfound fame. The miraculous lives and fascinating deaths of spiritual figures lent excitement to the lives of common people when there was often little else to be excited about, as they faced war, disease and food shortages.

E During the period 1300-1600 AD, or the Renaissance period as it is known, interest in ruling figures faded. As Europe emerged from its long neglect of the arts, there was greater appreciation for portraits, statues and stone carvings. This period of appreciation for the arts lent a sense of celebrity to artists who were noted for their works and their personal achievements. It was a time when artists began to surpass political and religious individuals for supreme celebrity – a trend that would continue into later centuries.

@bekhruzposts

Reviewed by @bekhruzposts

F While the figures of the ancient and early modern civilizations were able to achieve moderate and sometimes lasting celebrity within particular cultures, the global reach of their fame was limited. It was not until the 1700s, when technological advances made publishing commercially viable, that the extent of a person's fame could spread further. The increase in the availability of the written word was accompanied by a huge rise in the number of common people who could read, allowing a mass audience to find out about celebrities for the first time. Suddenly, the lives of authors, politicians, war heroes, and other celebrities could now be read about in newspapers around the world. These gave ordinary people the opportunity to become intimately knowledgeable about the figures they most admired.

G In the modern age, particularly as radio and film took off in the 1900s, things really began to change. First, radio began to make its way into the average home in the 1920s and 1930s. Professional athletes also began to be regarded as stars, as their games and exploits could be broadcast over the air for an entirely new audience. Then, the rise of television in the 1950s only cemented the premier level of celebrity that film stars, athletes and television actors were beginning to share. This also meant a huge increase in the individual salaries of these celebrities. Even a few animals gained fame through children's TV shows. The emergence of reality television shows in the late 1990s allowed all kinds of people with little ability to enjoy a short burst of fame on the television screen. All you needed, it seemed, was an attractive appearance. Today, reality television programmers make it possible to be famous not for doing anything in particular, but simply for being, with the audience deciding whether someone deserves to become a celebrity or not. As the meaning of celebrity continues to evolve and redefine itself in a quickly changing world, there is no telling who will become of interest next.

Reading Passage 3

Some Views on the Use of Headphones

Whether wearing headphones at work, or in other areas of everyday life, is a good thing or a bad thing has generated a lot of research and opinion

To visit a typical modern office today is to walk into a room with possibly a dozen songs playing simultaneously but to hear none of them. Up to half of younger workers listen to music on their headphones, and nearly all of them think it makes them better at their jobs. In survey after survey, people report with confidence that music makes them happier, better at concentrating, and more productive.

Scientists do not share this belief, they maintain that listening to music hurts people's ability to recall other things they should be doing, and any pop song, loud or soft, reduces overall performance for both extroverts and introverts. A Taiwanese study linked music that has lyrics to lower marks on concentration tests for college students, and other research has shown music with lyrics scrambles our brains' verbal-processing skills. 'As silence has the best overall performance, it would still be advisable that people work in silence,' another reporter dryly concluded.

The question is therefore: if headphones are so bad for productivity, why do so many people at work have them? One factor to consider is that countries like the USA have moved from a farming and manufacturing economy to a service economy, with an emphasis on jobs in offices that require higher levels of concentration, reflection and creativity. As an estimated 70 percent of office workers work in open-plan office spaces, it is more important to create one's own enclosing bubble of sound. Lending strength to the argument for headphones at work is evidence that music relaxes our muscles, improves our mood, and may even moderately reduce blood pressure, heart rate and anxiety.

The story of headphones began in 1910, when the US Navy received an odd letter written in purple ink on blue-and-pink paper. The letter writer, an eccentric inventor and repairman named Nathaniel Baldwin, from the USA state of Utah, made what at the time was an astonishing claim: he had built, in his kitchen, a new kind of headset that could amplify sound. This was an opportune invention for the Navy, who asked for a sound test and then enthusiastically adopted the headsets, later called headphones, and used them in World War I for naval radio communication.

The purpose of headphones is to concentrate a quiet and private sound in the ear of the listener, which is a radical departure from music's social purpose in history. 'Music, together with dance, co-evolved biologically and culturally to serve as a technology of social bonding,' Nills L Wallin and Bjorn Merker wrote in The Origins of Music. Songs don't leave behind fossils, but evidence of musical notation dates back to Sumeria, 3,500

Reviewed by @bekhruzposts

years ago, and in 1995 archeologists discovered a bone flute in southern Europe estimated to be 44,000 years old. If music evolved as a social glue for the species, as a way to make groups and keep them together, headphones have done what writing and literacy did for language – they made music private.

Author and columnist Stephen Marche wrote that separation from other people is one of the first things ordinary Americans spend their money achieving. It is 'a by-product of a long-standing national appetite for independence,' he said. Americans are not alone in their desire for personal independence and privacy. Marche is right; wealth can buy – and modern technology can deliver – personal independence, and it is this that people have always sought.

Dr Michael Bull, an expert on personal music devices from the University of Sussex in the UK, has repeatedly made the larger point that personal music devices change how we relate to public spaces. Controlling our public spaces is more important now that more people are moving from the edges of cities to live in urban centers. 'With the urban space, the more it's inhabited, the safer you feel,' Bull says. 'You feel safe if you can feel people there, but you don't want to interact with them.' Headphones create shields for wearers, separating them from other people and their surroundings. Headphones have their own rules of good manners; they are like wearing a 'Do not disturb' sign. We assume that people wearing them are busy and we should respect their privacy, so now people wear them to appear busy. In fact, it is now becoming quite common for people not to listen to anything at all, but just to wear headphones.

However, as pointed out at the beginning of this piece, although scientists have stated that headphones are bad for productivity, people still wear them at work. It is not just that headphones create privacy out of public areas, but also that music causes people to relax and reflect and pause. The outcome of relaxation, reflection and pausing at work won't be captured in minute-to-minute productivity metrics. What must be considered is that in moments of extreme focus, our attention radiates outward, toward the problem, rather than inward, on how to solve the problem. However, with music 'When our minds are at ease, we're more likely to direct the spotlight of attention inward,' Jonah Lehrer wrote in his book Imagine: How Creativity Works. 'The answers have been there all along. We just weren't listening.' In a crowded world, real estate is the ultimate scarce resource, and a headphone is a small invisible fence around our minds – making space, creating separation, and helping us listen to ourselves.

Choose the correct letter, **A**, **B**, **C** *or* **D**.

32 What does the writer suggest about a service economy?

A The work is mentally demanding.
B It provides employment for younger workers.
C It is a small part of a country's economy.
D Workers have to live in urban centres.

33 When the writer mentions the historical evidence for early music he is

A emphasizing the diversity of musical forms.
B expressing his frustration with the limited archaeological evidence uncovered.
C lending support to the view that music has been important in human history.
D creating a geographical map of the evolution of music.

34 What does the writer say about the social effects of listening to music through headphones?

A It has caused a reduction in the number of people who listen to music.
B It has increased people's participation in music events.
C It has reduced the global variation of music styles.
D It has changed the traditional role of music in society.

35 What does the writer say about personal independence?

A Americans are unique in their desire for personal independence.
B Personal independence is something that can be purchased.
C Striving for personal independence is a recent phenomenon.
D Personal independence destroys social connections.

36 Why does the writer quote Jonah Lehrer in the last paragraph?

A to support the writer's own view
B to draw attention to an authoritative book about music
C to raise awareness of people's loss of listening skills
D to illustrate how music brings people closer to each other

Reading Passage 1

How to Find Your Way Out of a Food Desert

Ordinary citizens have been using the internet to draw attention to the lack of healthy eating options in inner cities

Over the last few months, a survey has been carried out of over 200 greengrocers and convenience stores in Crown Heights, a neighborhood in Brooklyn, New York. As researchers from the Brooklyn Food Association enter the details, colorful dots appear on their online map, which display the specific location of each of the food stores in a handful of central Brooklyn neighborhoods. Clicking on a dot will show you the store's name and whether it carries fresh fruit and vegetables, wholegrain bread, low-fat dairy and other healthy options.

The researchers plan eventually to survey the entire borough of Brooklyn. 'We want to get to a more specific and detailed description of what that looks like', says Jeffrey Heehs, who leads the project. He hopes it will help residents find fresh food in urban areas where the stores sell mostly packaged snacks or fast food, areas otherwise known as food deserts. The aim of the project is also to assist government officials in assessing food availability, and in forming future policies about what kind of food should be sold and where.

In fact, the Brooklyn project represents the intersection of two growing trends: mapping fresh food markets in US cities, and private citizens creating online maps of local neighborhood features. According to Michael Goodchild, a geographer at the University of California at Santa Barbara, citizen map makers may make maps because there is no good government map, or to record problems such as burned-out traffic lights.

According to recent studies, people at higher risk of chronic disease and who receive minimal incomes for the work they do, frequently live in neighborhoods located in food deserts. But how did these food deserts arise? Linda Alwitt and Thomas Donley, marketing researchers at DePaul University in Chicago, found that supermarkets often can't afford the amount of land required for their stores in cities. City planning researcher Cliff Guy and colleagues at the University of Leeds in the UK found in 2004 that smaller urban groceries tend to close due to competition from suburban supermarkets.

Reviewed by @bekhruzposts

As fresh food stores leave a neighborhood, residents find it harder to eat well and stay healthy. Food deserts are linked with lower local health outcomes, and they may be a driving force in the health disparities between lower-income and affluent people in the US. Until recently, the issue attracted little national attention, and received no ongoing funding for research.

Now, more US cities are becoming aware of their food landscapes. Last year, the United States Department of Agriculture launched a map of where food stores are located in all the US counties. Mari Gallagher, who runs a private consulting firm, says her researchers have mapped food stores and related them to health statistics for the cities of Detroit, Chicago, Cincinnati and Washington, D.C. These maps help cities identify where food deserts are and, occasionally, have documented that people living in food deserts have higher rates of diet-related diseases.

The Brooklyn project differs in that it's run by a local core of five volunteers who have worked on the project for the past year, rather than trained, academic researchers. To gather data, they simply go to individual stores with pre-printed surveys in hand, and once the storekeeper's permission has been obtained, check off boxes on their list against the products for sale in the store. Their approach to data collection and research has been made possible by technologies such as mapping software and GPS-related smart phones, Google Maps and OpenStreetMap, an open-source online map with a history of involvement in social issues. Like Brooklyn Food Association volunteers, many citizen online map makers use maps to bring local problems to official attention, Goodchild says. Heehs, the mapping project leader, says that after his group gathers more data, it will compare neighborhoods, come up with solutions to address local needs, and then present them to New York City officials. Their website hasn't caught them much local or official attention yet, however. It was launched only recently, but its creators haven't yet set up systems to see who's looking at it.

Experts who visited the Brooklyn group's site were optimistic but cautious. 'This kind of detailed information could be very useful' says Michele Ver Ploeg, an economist for the Department of Agriculture. To make the map more helpful to both residents and policy makers, she would like to see price data for healthy products, too. Karen Ansel, a registered dietician and a spokesperson for the American Dietetic Association, found the site confusing to navigate. 'That said, with this information in place the group has the tools to build a more user-friendly site that could be ... very helpful to consumers', she says. 'The group also should ensure their map is available to those who don't have internet access at home', she adds. In fact, a significant proportion of Brooklyn residents don't have internet access at home and 8 percent rely on dial-up service, instead of high-speed internet access, according to Gretchen Maneval, director of Brooklyn College's Center for the Study of Brooklyn. 'It's still very much a work in progress', Heehs says of the online map. They'll

Reviewed by @bekhruzposts

start advertising it online and by email to other community groups, such as urban food garden associations, next month. He also hopes warmer days in the spring will draw out fresh volunteers to spread awareness and to finish surveying, as they have about two-thirds of Brooklyn left to cover.

Questions 1–6

Complete the notes below. Choose **ONE WORD ONLY** *from the passage for each answer.*

Data on food deserts and their effects on health

THE BROOKLYN FOOD ASSOCIATION

- The online map provides users with a store's name, (1) and details of its produce
- One goal of the mapping project is to help develop new (2) on food.
- Citizen maps are sometimes made when (3) maps are unsatisfactory.

REASONS FOR THE DEVELOPMENT OF FOOD DESERTS

- New research suggests that people living in food deserts often have low (4)
- Some supermarkets are unable to buy enough (5) inside cities for their stores
- Small grocery stores in cities often cannot cope with supermarket (6)

Reading Passage 2

The Dingo Debate

Graziers see them as pests, and poisoning is common, but some biologists think Australia's dingoes are the best weapon in a war against imported cats and foxes

A A plane flies a slow pattern over Carlton Hill station, a 3,600 square kilometre ranch in the Kimberley region in northwest Australia. As the plane circles, those aboard drop 1,000 small pieces of meat, one by one, onto the scrubland below, each piece laced with poison; this practice is known as baiting.

Besides 50,000 head of cattle, Carlton Hill is home to the dingo, Australia's largest mammalian predator and the bane of a grazier's (cattle farmer's) life. Stuart McKechnie, manager of Carlton Hill, complains that graziers' livelihoods are threatened when dingoes prey on cattle. But one man wants the baiting to end, and for dingoes to once again roam Australia's wide-open spaces. According to Chris Johnson of James Cook University, 'Australia needs more dingoes to protect our biodiversity.'

B About 4,000 years ago, Asian sailors introduced dingoes to Australia. Throughout the ensuing millennia, these descendants of the wolf spread across the continent and, as the Tasmanian tiger disappeared completely from Australia, dingoes became Australia's top predators. As agricultural development took place, the European settlers found that they could not safely keep their livestock where dingoes roamed. So began one of the most sustained efforts at pest control in Australia's history. Over the last 150 years, dingoes have been shot and poisoned, and fences have been used in an attempt to keep them away from livestock. But at the same time, as the European settlers tried to eliminate one native pest from Australia, they introduced more of their own.

C In 1860, the rabbit was unleashed on Australia by a wealthy landowner and by 1980 rabbits had covered most of the mainland. Rabbits provide a huge prey base for two other introduced species: the feral (wild) cat and the red fox.

The interaction between foxes, cats and rabbits is a huge problem for native mammals. In good years, rabbit numbers increase dramatically, and fox and cat populations grow quickly in response to the abundance of this prey. When bad seasons follow, rabbit numbers are significantly reduced – and the dwindling but still large fox and cat populations are left with little to eat besides native mammals.

D Australian mammals generally reproduce much more slowly than rabbits, cats and foxes – and adaption to prevent overpopulation in the arid environment, where food can be scarce and unreliable – and populations decline because they can't grow fast enough to

@bekhruzposts
Reviewed by @bekhruzposts

replace animals killed by the predators. Johnson says dingoes are the solution to this problem because they keep cat and fox populations under control. Besides regularly eating the smaller predators, dingoes will kill them simply to lessen competition.

Dingo packs live in large, stable territories and generally have only one fertile female, which limits their rate of increase. In the 4,000 years that dingoes have been in Australia, they have contributed to few, if any, extinctions, Johnson says.

E Reaching out from a desolate spot where three states meet, for 2,500 km in either direction, is the world's longest fence, two metres high and stretching from the coast in Queensland to the Great Australian Bight in South Australia; it is there to keep dingoes out of southeast Australia. Elsewhere, the fence separates the main types of livestock found in Australia. To the northwest of the fence, cattle predominate; to the southwest, sheep fill the landscape. In fact, Australia is a land dominated by these animals – 25 million cattle, 100 million sheep and just over 20 million people.

F While there is no argument that dingoes will prey on sheep if given the chance, they don't hunt cattle once the calves are much past two or three weeks old, according to McKechnie. And a study in Queensland suggests that dingoes don't even prey heavily on the newborn calves unless their staple prey disappears due to deteriorating conditions like drought.

This study, co-authored by Lee Allen of the Robert Wicks Research Centre in Queensland, suggests that the aggressive baiting programs used against dingoes may actually be counter-productive for graziers. When dingoes are removed from an area by baiting, the area is recolonized by younger, more solitary dingoes. These animals aren't capable of going after the large prey like kangaroos, so they turn to calves. In their study, some of the highest rates of calf predation occurred in areas that had been baited.

G Mark Clifford, general manager of a firm that manages over 200,000 head of cattle, is not convinced by Allen's assertion. Clifford says, 'It's obvious if we drop or loosen control on dingoes, we are going to lose more calves.' He doesn't believe that dingoes will go after kangaroos when calves are around. Nor is he persuaded of dingoes' supposed ecological benefits, saying he is not convinced that they manage to catch cats that often, believing they are more likely to catch small native animals instead.

H McKechnie agrees that dingoes kill the wallabies (small native animals) that compete with his cattle for food, but points out that in parts of Western Australia, there are no foxes, and not very many cats. He doesn't see how relaxing controls on dingoes in his area will improve the ecological balance.

Reviewed by @bekhruzposts

Johnson sees a need for a change in philosophy on the part of graziers. 'There might be a number of different ways of thinking through dingo management in cattle country,' he says. 'At the moment, though, that hasn't got through to graziers. There's still just one prescription, and that is to bait as widely as possible.'

Questions 14–20

Reading Passage 2 has eight sections, **A–H**. *Which section contains the following information? (NB You may use any letter more than once.)*

Q	Information	Answer
14	a description of a barrier designed to stop dingoes, which also divides two kinds of non-native animals	
15	how dingoes ensure that rival species do not dominate	
16	a reference to a widespread non-native species that other animals feed on	
17	a mention of the dingo's arrival in Australia	
18	research which has proved that dingoes have resorted to eating young livestock	
19	a description of a method used to kill dingoes	
20	the way that the structure of dingo groups affects how quickly their numbers grow

Reading Passage 3

Pacific Navigation and Voyaging

How people migrated to the Pacific islands

The many tiny islands of the Pacific Ocean had no human population until ancestors of today's islanders sailed from Southeast Asia in ocean-going canoes approximately 2,000 years ago. At the present time, the debate continues about exactly how they migrated such vast distances across the ocean, without any of the modern technologies we take for granted.

Although the romantic vision of some early twentieth-century writers of fleets of heroic navigators simultaneously setting sail had come to be considered by later investigators to be exaggerated, no considered assessment of Pacific voyaging was forthcoming until 1956 when the American historian Andrew Sharp published his research. Sharp challenged the 'heroic vision' by asserting that the expertise of the navigators was limited, and that the settlement of the islands was not systematic, being more dependent on good fortune by drifting canoes. Sharp's theory was widely challenged, and deservedly so. If nothing else, however, it did spark renewed interest in the topic and precipitated valuable new research.

Since the 1960s a wealth of investigations has been conducted, and most of them, thankfully, have been of the 'non-armchair' variety. While it would be wrong to denigrate all 'armchair' research – that based on an examination of available published materials – it has turned out that so little progress had been made in the area of Pacific voyaging because most writers relied on the same old sources – travelers' journals or missionary narratives compiled by unskilled observers. After Sharp, this began to change, and researchers conducted most of their investigations not in libraries, but in the field.

In 1965, David Lewis, a physician and experienced yachtsman, set to work using his own unique philosophy: he took the yacht he had owned for many years and navigated through the islands in order to contact those men who still find their way at sea using traditional methods. He then accompanied these men, in their traditional canoes, on test voyages from which all modern instruments were banished from sight, though Lewis secretly used them to confirm the navigator's calculations. His most famous such voyage was a return trip of around 1,000 nautical miles between two islands in mid-ocean. Far from drifting, as proposed by Sharp, Lewis found that ancient navigators would have known which course to steer by memorizing which stars rose and set in certain positions along the horizon and this gave them fixed directions by which to steer their boats.

The geographer Edwin Doran followed a quite different approach. He was interested in obtaining exact data on canoe sailing performance, and to that end employed the latest electronic instrumentation. Doran traveled on board traditional sailing canoes in some of

@bekhruzposts
Reviewed by @bekhruzposts

the most remote parts of the Pacific, all the while using his instruments to record canoe speeds in different wind strengths – from gales to calms – the angle canoes could sail relative to the wind. In the process, he provided the first really precise attributes of traditional sailing canoes.

A further contribution was made by Steven Horvath. As a physiologist, Horvath's interest was not in navigation techniques or in canoes, but in the physical capabilities of the men themselves. By adapting standard physiological techniques, Horvath was able to calculate the energy expenditure required to paddle canoes of this sort at times when there was no wind to fill the sails, or when the wind was contrary. He concluded that paddles, or perhaps long oars, could indeed have propelled for long distances what were primarily sailing vessels.

Finally, a team led by P Wall Garrard conducted important research, in this case by making investigations while remaining safely in the laboratory. Wall Garrard's unusual method was to use the findings of linguists who had studied the languages of the Pacific islands, many of which are remarkably similar although the islands where they are spoken are sometimes thousands of kilometres apart. Clever adaptation of computer simulation techniques pioneered in other disciplines allowed him to produce convincing models suggesting the migrations were indeed systematic, but not simultaneous. Wall Garrard proposed the migrations should be seen not as a single journey made by a massed fleet of canoes, but as a series of ever more ambitious voyages, each pushing further into the unknown ocean.

What do we learn about Pacific navigation and voyaging from this research? Quite correctly, none of the researchers tried to use their findings to prove one theory or another; experiments such as these cannot categorically confirm or negate a hypothesis. The strength of this research lay in the range of methodologies employed. When we splice together these findings we can propose that traditional navigators used a variety of canoe types, sources of water and navigation techniques, and it was this adaptability which was their greatest accomplishment. These navigators observed the conditions prevailing at sea at the time a voyage was made and altered their techniques accordingly. Furthermore, the canoes of the navigators were not drifting helplessly at sea but were most likely part of a systematic migration; as such, the Pacific peoples were able to view the ocean as an avenue, not a barrier, to communication before any other race on Earth. Finally, one unexpected but most welcome consequence of this research has been a renaissance in the practice of traditional voyaging. In some groups of islands in the Pacific today young people are resurrecting the skills of their ancestors, when a few decades ago it seemed they would be lost forever.

Questions 32–36

Choose the correct letter, **A**, **B**, **C** *or* **D**.

32 David Lewis's research was different because

A he observed traditional navigators at work.

B he conducted test voyages using his own yacht.

C he carried no modern instruments on test voyages.

D he spoke the same language as the islanders he sailed with.

33 What did David Lewis's research discover about traditional navigators?

A They used the sun and moon to find their position.

B They could not sail further than about 1,000 nautical miles.

C They knew which direction they were sailing in.

D They were able to drift for long distances.

34 What are we told about Edwin Doran's research?

A Data were collected after the canoes had returned to land.

B Canoe characteristics were recorded using modern instruments.

C Research was conducted in the most densely populated regions.

D Navigators were not allowed to see the instruments Doran used.

35 Which of the following did Steven Horvath discover during his research?

A Canoe design was less important than human strength.

B New research methods had to be developed for use in canoes.

C Navigators became very tired on the longest voyages.

D Human energy may have been used to assist sailing canoes.

36 What is the writer's opinion of P Wall Garrard's research?

A He is disappointed it was conducted in the laboratory.

B He is impressed by the originality of the techniques used.

C He is surprised it was used to help linguists with their research.

D He is concerned that the islands studied are long distances apart.

Reading Passage 1

Traditional Maori Medicine

The Maori are the indigenous people of the islands of New Zealand. Their traditional medicine, which is believed to date back as far as the 13th century, was a system of healing that was passed down through the generations orally. It comprised diverse practices and placed an emphasis on the spiritual dimension of health. Its practice included remedies made from herbs, and physical therapies such as massage to relieve discomfort in the muscles and bones.

Maori systems for treating illness were well developed before Europeans arrived in New Zealand in the late 1700s: they had quite detailed knowledge of anatomy and recognition of the healing properties of various plants. When Europeans first visited New Zealand, the average age of death for Maori adults was around 30. However, apart from this, the people were fit and healthy, and troubled by few diseases.

Illness was often seen as spiritually based. Maori saw themselves as guardians of the earth, and the focus of their existence was to remain at one with the natural and supernatural world. Rather than a medical problem, sickness was often viewed as a symptom of disharmony with nature.

In Maori culture, illnesses were divided into diseases of the gods (mate atua) and physical diseases (mate tangata). Diseases sent by the gods were often attributed to attacks by evil spirits, because the person had broken a religious rule. For instance, for Maori, places where people had died, or places where their ancestors were buried were sacred, so if someone took food from a river where someone had died, or took a stick from a tree that had held their ancestor's bones and placed it on a cooking fire, it was believed that the gods could punish them for their disrespectful acts by making them sick.

More than 200 plants were used medicinally by Maori. The leaves of the flax plant were used to treat skin infections and food poisoning, and the hard part of the leaf was also used as a splint or brace for broken bones and injured backs. Flax fibres were used along with a sharpened stick to sew up bad cuts. The bark and leaves of the pepper tree were used to heal cuts, wounds and stomach pain. People who had toothache were instructed to chew the leaves of this same tree, and this was found to be of considerable benefit. The pepper tree was also used in vapour baths to treat people with painful joints.

@bekhruzposts

Reviewed by @bekhruzposts

Colonization by Europeans in the 1800s had a significant effect on traditional Maori healing. Europeans brought many new diseases with them which Maori healers had limited ability to combat. Though Western medicine was also relatively ineffectual at the time, this failure still strongly affected Maori confidence in their healers. Some western missionaries attributed the spread of disease to the fact the Maori did not believe in Christianity, and as Maori healers appeared powerless, many Maori accepted this explanation and turned to Christianity. Over time the schools of higher learning which had trained healers started to close and the tradition of the Maori healer declined.

From the late 20th century, there was renewed Maori interest in their traditional medicine. This was due to several factors. There was a resurgence of all aspects of Maori culture in New Zealand. Furthermore, people started to be less trusting of Western medicine – statistics from the 1970s came out revealing that Maori health continued to be poorer than that of other New Zealanders. There were also problems with access to health care for Maori. Additionally, there was and still is today a perceived lack of a spiritual dimension in Western health services.

Although Maori today largely accepted Western concepts of health and illness, and use the mainstream health system, there is significant demand for traditional medicine. This is true for unusual illnesses, or those that fail to respond to standard medical treatment, but also for common ailments such as the cold and influenza.

Today's healers differ significantly from those of old times. Training is highly variable, usually informal, and often less tribally bound than the rigorous education of the traditional houses of higher learning. Many modern healers work in urban clinics, some alongside mainstream health professionals. They experiment, incorporating knowledge from Western and other medical systems. As a result, their modern day work has no standard system of diagnosis or widespread agreement about treatments. Despite this, many healers are recognized as having knowledge and ability that has been passed down from their ancestors. The Maori language is also seen as important by many of those receiving treatment.

Reading Passage 2

Classical Music Over the Centuries

A The production of any great art form, and classical music is no exception, does not usually occur in a society dominated by the basic material demands of food and shelter—Art and music have flourished in those periods of history, and those parts of society, in which the luxury of free time and material wealth has allowed such a culture to take precedence over more material matters. In the medieval European world, it was thus primarily in the closed communities of the church and monastery, and royal courts that music, literature and learning were able to flourish.

B It was not until the 18th century that this situation changed to any great extent, and the rise of an economically independent middle class meant that concert going became a public activity for anyone who cared to buy a ticket. It is worth remembering that the idea of classical music widely accepted today did not exist until about 300 years ago. Performing music in concert halls to a paying audience, as something inherently pleasurable and significant, was pretty much unheard of until the 18th century, and not widely established until the 19th. The concert venue, the audience, and the idea of 'masterpieces' of classical music, were all effectively invented during the course of the 18th century—in London, Paris, Vienna, Berlin and other European cities where the arts in general were blossoming.

C Today, music that was originally written for a concert venue may appear, out of its original context, in an advert or film. Conversely, music written specifically for films is sometimes performed live. But nothing has changed music over the last century more radically than the invention and dissemination of recording technologies. However, although Thomas Edison originally developed the phonograph in 1877, and wax cylinders were used as early as 1880s for recording music, commercial recordings of music were not generally available to the majority until 1920s. From the mid-1980s onwards, the vinyl disc gradually gave way to the new technology of the CD, but just a decade later, the digital MP3 file was already displacing the CD as the favoured way to produce recorded music. Yet now, people have more music stored on their phones or computers—which they can call up with the touch of a finger—than would have been contained on all the metres of library shelves of a proud 'record collector' of the 20th century.

D Before recording, music was a social event—it involved one or more people coming together to make music. The music lasted for as long as the musicians sang or played and then it was over. Therefore, the only music that was heard tended to be composition by recent or living musicians, probably working in the locality; it was rare to hear music from

Reviewed by @bekhruzposts

a past generation, distant place or culture. Even when music became professionalized, people who wanted to listen to music went to a specific venue, at a specific time, to hear musicians create a one-off event.

E These days, however, technology makes almost all the world's music instantly and constantly available to anyone with access to simple and cheap gadgets designed for playing it. Music thus floats free of any specific occasion or venue. It is no longer restricted to a particular audience or group of musicians. For the first time, music (any music) can be entirely personal affair. This is one of the reasons that the 'classical' label becomes harder to pin down. One of its distinctive aspects—a performance defined by concert halls and opera houses—is dissolved by digital recording formats. As a consequence all music, classical music included, can become any person's soundtrack for activities such as commuting, exercising or shopping.

F The ubiquity of music as recorded sound means that it's very easy to overlook perhaps the most definitive aspect of the classical music tradition—the fact that it is a written or notated music. Though classical music may lack a precise definition today and mean quite different things to different people, at its heart is the idea of a music that has remained viable over the years because it was written down in some form. The origin of what music historians think of as classical music dates from the ninth century, when a system of musical notation was first developed. Before this time, singers in religious services in cathedrals or monasteries had to learn by heart a huge repertory of chants. The first attempts to notate music were intended to help them remember these. Over the next thousand years, notation became more complex, incorporating such aspects as rhythm and pitch, allowing composers to rework and refine their musical ideas. Put very simply, the history of classical music, in all its varied forms, is the history of a tradition that grew out of the possibilities of musical notation.

Questions 22 and 23

Choose **TWO** *letters,* **A–E**. *Which TWO of the following statements does the writer make about musical notation?*

22

23

A The way it is interpreted has changed over time
B It was originally designed as a memory aid
C It is often ignored by classical musicians today
D Classical music could not have survived without it
E Its importance diminished with the arrival of recording

Questions 24–26

Complete the summary below. Choose **ONE WORD ONLY** *from the passage for each answer.*

The impact of today's technology on music

These days, the world's music is instantly and constantly available to almost everyone. Thus, music is no longer tied to a particular location or occasion, nor is it associated with a group of musicians or a specific 24 ———————. It can become, uniquely in its history, completely personal to each and every individual. Thanks to digital recording, the need for venues such as opera houses or 25 ——————— where concerts are performed has vanished. Digitization has also made it possible for people to treat music as a 26 ——————— to their daily activities.

Reading Passage 3

Mapping the Mind

Dr Simon Hanson reviews Rita Carter's book Mapping the Mind

The often used phrase 'I'll believe it when I see it' betrays a very intimate fact of human nature. We are visual creatures and we rely on sight to serve as a judge of what is real and what is not. When discussing the intricacies of the human mind, for most of society's existence things have not been visible; we have for the most part relied on intangible concepts, metaphors, and words to explore our inner psyche. I have no idea what my ego looks like. I must have one because it can be hurt or appeased by how others treat me. But how do I know it really exists? Recent progress in brain research and neuroimaging are changing all of this. With our modern technology of functional imaging, we can now look at the brain as it is working, and attribute activation in certain areas of the brain to behaviours, thoughts, and feelings. In essence, our new tools are prompting new thoughts on who we are and how we are organized. Rita Carter's book, Mapping the Mind, explores these issues and exploits science's ability to look into our heads as a tool to examine who we are.

In its most basic form, Carter's book serves as a very accessible introduction to the subject of Neuroanatomy, a subject most of us would not appreciate fully without investing in a semester of medical school. Mapping the Mind uses beautifully rendered three-dimensional computer images of the brain to explain anatomical structures and pathways. The presentation style acknowledges our natural bias towards perceiving and learning information visually. Presenting the concept of a brain area devoted to maintaining attention by calling it the 'anterior cingulate cortex' would probably put most readers to sleep while their brains struggled to use that area to focus on what the name meant. Showing the reader a three-dimensionally-oriented area that easily translates to a place we can point to on our skulls grounds the anatomical vocabulary in something we can all understand—our own heads.

In spite of the title, however, the book is not an exact map or reference guide. Its chapters cover concepts such as perception, emotions, memory, and higher consciousness, and are best read rather than referenced. The book, beautifully accented with brain-oriented artwork of both pure esthetic and illustrative value, walks a pleasing line between college textbook and coffee table art book, describing the subtle nuances of vision, language, thought, and feeling with science and art.

While the art requires no explanations, Carter uses her background as a journalist to keep the reader engaged in the science. Factual support in the form of documented cases is liberally employed to show the abstract concepts in recognizable behaviors and

Reviewed by @bekhruzposts

consequences we can all relate to. For example, in describing brain circuitry involved in controlling anger, Carter uses familiar situations, like suppressing anger when we feel we have been insulted, to illustrate the neuroscience involved. She follows with a discussion of children's emotional maturity, pointing out that in children the areas involved in inhibition of anger are not as well developed as in adults, providing an explanation for the tantrums of a six-year-old. Carter presents the science in an engaging yet factual manner, allowing people to draw their own conclusions and connect the dots between scientific discovery and what it means in our daily lives.

By presenting neuroscience in this manner, Mapping the Mind seems to aim itself at an audience that is often forgotten: the general reader who wants to know more about a specific area of scientific study. From a scientific perspective, danger often lurks when writing for a general audience as scientific credibility can be sacrificed in order to keep readers engaged. Carter circumvents this problem by including the participation of research scientists in the writing. The book is littered with short directed essays written by specialists in specific areas of brain research.

One of my favorite features of the book is the optical illusions. As a teacher, I am always searching for ways to make information relevant to the reader. Mapping the Mind does this by peppering appropriate chapters with optical illusions that illustrated how the brain processes information. These delicious enigmas do not stand alone as supplementary information or unrelated facts but are accompanied by textual explanations and insights into what causes the perceptual incongruities. I found many of these explanations so good at conveying basic brain principles that I borrowed some of them for use in lectures.

From our unique place in history we can, at present, use our overly developed neo-cortex in combination with the tools of science to examine our own minds at work. Our journey is to try and figure out who we are. Rather than providing us with an academic textbook, Mapping the Mind serves as a sort of kiosk map saying 'you are here' with a big red dot. Mapping the Mind shows us where we are by giving us a snapshot of how we work. There are many books out there that explain the mind. The unique perspective of this book is that it uses the brain itself to guide the journey.

Questions 33–37

Choose the correct letter, **A**, **B**, **C** *or* **D**.

33 According to the writer, Carter's background in journalism means that

A she has easy access to relevant sources.
B she cannot explain complex medical ideas.
C her writing style maintains the reader's interest.
D her presentation of information is more suited to newspapers.

34 When discussing how the brain works in controlling anger, Carter

A gives guidance to parents of young children.
B uses examples readers can relate to.
C admires the control shown by adults.
D criticizes the behaviour of children.

35 The writer feels that the way neuroscience is presented in Mapping the Mind

A will not give readers any new information.
B could make readers doubt scientific claims.
C will encourage more people to study neuroscience.
D will appeal to readers with no knowledge of the topic.

36 The writer especially likes the optical illusions in Mapping the Mind because they

A help people relate to the topic.
B are a long-standing scientific mystery.
C can teach us about the function of the eye.
D have never appeared in books about the brain before.

37 The writer says that Mapping the Mind operates as a 'kiosk map' because

A it reveals our current position in terms of our knowledge of the brain.
B the reader can become lost in other textbooks about the brain.
C it describes specific areas of the brain such as the neo-cortex.
D its illustrations are particularly clear and accurate.

Reading Passage 1

A Brief Introduction to Pepper

Pepper, the spice, comes from the berries of a plant that is a woody climbing vine. In the botanical world, pepper belongs to a genus of plants called Piper. This genus was created in 1753 by Carl Linnaeus, the Swedish botanist whose system for classifying plants is still in use today. He placed seventeen species in the Piper genus and probably used the ancient Greek name for black pepper, Peperi, as the basis for the group.

Pepper isn't a fast-maturing plant. It takes several years for the branching woody vines to mature, and during their growth the vines can reach up to thirty feet. The pepper berries, which grow in clusters and dangle from the vines, are picked by hand when they are ready for harvesting, which usually begins two or three years after the vine is first planted. Black pepper is picked when the berries are still green, while white pepper is picked later, when the berries have turned from green to red. Preparing the berries for sale involves a lengthy process of drying, cleaning and sorting. Once the berries have been dried, they are then referred to as peppercorns, and these are what are used in food preparation around the world.

The pepper plant loves the warm, humid, rainy tropics, in a narrow band around the equator. Pepper also requires well-drained soils, and its preferred habitat is forests. Unshaded plants which are exposed too long to the sun will not yield many berries. The colourful mixes of whole peppercorns seen in many markets today contain green and black peppercorns. Although there are pink peppercorns, the ripest berries, these are more fragile and are therefore more costly than other kinds. This is why there are few of them in a peppercorn mix.

No one knows when the first human bit into a peppercorn and decided it would taste good on a piece of meat or in a vegetable stew, but in the West it was the ancient Romans who apparently first made pepper an essential part of their meals. Food was only part of the reason for pepper's popularity; health played an equally important role. In the Roman Empire, pepper was employed to relieve the pain that was a common consequence of numerous medical conditions and complaints. If you showed signs of a fever, it was common practice to be given a liquid that had some pepper in it.

Reviewed by @bekhruzposts

The Romans were not the first to embrace pepper as a medicine. Belief in the spice's considerable usefulness is reflected in India's ancient Ayurvedic system of medicine, which is more than three thousand years old. In Sanskrit (a language of ancient India), black pepper is known as maricha or marica, meaning an ability to get rid of poison, which suggests it was used in patients for this purpose. Pepper was also believed by the Indians to have other qualities as well. For example, physicians would frequently apply pepper-based lotions to reduce the effects of decay in teeth, which made it an extremely popular remedy.

In the Middle Ages (5th-15th centuries) black pepper's renown made it a must-have item for the European wealthy, who loved the spice. At that time, pepper was guarded by servants in royal households and kept in the private wardrobes of the rich. It was considered a privilege to cook with pepper and many of the recipes from the period called for substantial quantities of pepper, which might be considered very unappetising today. But for most people, pepper was too expensive. In the year 1439, a pound of pepper was roughly equal to more than two days' pay in England. Meanwhile, pepper could be exchanged for gold, and also became a form of payment for people's work. In some of the larger cities, it was even possible to use pepper as rent in some kinds of accommodation. Employees in the pepper industry were not allowed to have pockets in their jackets or trousers so that this valuable commodity would not be stolen.

The huge demand for pepper and the money it could bring encouraged people to risk adventure on foreign oceans and in foreign lands, and it is within this context that the story of pepper really begins.

Reading Passage 2

The Horseshoe Crab

A One of the world's oldest animal species, the horseshoe crab, is found along the east coast of the United States and Mexico. Fossil records indicate this creature dates back 450 million years, and it has changed very little over time. This is because its anatomy has been so successful. In fact, the horseshoe crab is more closely related to spiders, scorpions and ticks than it is to true crabs and other crustaceans.

B The soft body of the horseshoe crab is protected by a large oval shell with jagged, pointed spines. The two-part body consists of a head and an abdominal region. The head region contains a brain, heart, mouth, four eyes and six pairs of legs. What is significant is that horseshoe crabs possess the rare ability to regrow lost limbs. They also use crawling as their primary means of movement, and commonly bury themselves under the surface of the sand. However, in the water, they will occasionally turn onto their backs and swim upside-down. The mouth of the horseshoe crab is located between the twelve legs. They can only eat when crawling, as the motion allows them to open and close their mouths. Their diet consists mainly of worms and clams.

The abdominal region contains muscles for movement and gills for breathing. A long spine forming a tail, called a telson, is located behind the abdominal region. Although this part of the body looks intimidating, it is not dangerous, poisonous or used to sting. Horseshoe crabs use it to flip over if they happen to be pushed onto their backs, but this is only possible under the sea. Every year, about 10 percent of the horseshoe crab breeding population dies while on the beach, when rough surf flips the creatures onto their backs, a position from which they often cannot right themselves.

C Another distinctive feature of horseshoe crabs is that they do not have hemoglobin (a protein that contains the mineral iron), which gives blood its red colour. Hemoglobin is the basis of oxygen transport in the blood of mammals, reptiles and birds. Rather, the blood of horseshoe crabs has a copper-containing protein called hemocyanin. Hemocyanin is dark blue when it is transporting oxygen and colourless when it is not. The oxygen is also transported in a fluid on the exterior of the cell, in contrast to most animals, where oxygen molecules are transported inside red blood cells. In fact, these enzymes are used by astronauts on the International Space Station to test surfaces for unwanted bacteria and fungi. Another application is a protein from horseshoe crab blood that is under investigation as an antibiotic.

D The horseshoe crab faces the greatest dangers in early life. Between April and June, adult horseshoe crabs travel from deep ocean waters to converge on beaches. Crawling out of the sea and onto the beach is especially common at high tides during full and new

@bekhruzposts
Reviewed by @bekhruzposts

moons. The males arrive first and await the females for breeding. Female horseshoe crabs communicate by releasing a scent to signal to the males.

Then female horseshoe crabs create nests by digging holes in the sand and laying between 60,000 and 120,000 eggs at a time before covering them with sand for protection. Most eggs do not survive the hatching period before being eaten, as the eggs are a food source for numerous birds, reptiles and fish.

E If the egg does survive, the young horseshoe crab will hatch after five weeks. Referred to as larvae, they look like miniature versions of adult horseshoe crabs. When first entering the sea, they exhibit a 'swimming frenzy' similar to that of newborn sea turtles, swimming vigorously and continuously for hours. During the larval stage, which can last a year or more, newly hatched horseshoe crabs travel into the ocean water and settle on the sandy bottom in shallow waters. As they develop, they move into deeper waters.

After the larval stage, horseshoe crabs move into the juvenile period. The juvenile horseshoe crabs will slowly grow over a period of about ten years. The growing process requires shedding small exterior shells, known as exoskeletons, in exchange for larger shells. Horseshoe crabs can shed up to 17 exoskeletons during development and their entire life span can be over twenty years. Mature females can reach 45-50 centimetres from head to tail, while the males grow to approximately 35-40 centimetres.

F Despite their long history, horseshoe crabs face increased threats in modern times. For this reason, scientists have been studying the populations of horseshoe crabs, but more investigation is needed, particularly on the coast of Florida. A widespread decline in their abundance in the last 20 years may be especially severe in the Indian River Lagoon system in Florida. While the horseshoe crab is not currently listed as threatened, there is rising concern about the fact that it is increasingly absent from the Indian River Lagoon system, where it has historically been common. Loss of the horseshoe crab would negatively impact species that feed on the animal and its eggs and would decrease the biodiversity of the lagoon. Moreover, this development might indicate serious ecological disturbance in the region. In the northeast, the use of horseshoe crabs as bait to catch fish over the past ten years is, in part, responsible for a rapidly declining population of this unique species, and it is suspected that this is also a problem in Florida. However, the extent of this has not been well documented.

Reading Passage 3

Temperament

Although temperament, the way an individual normally behaves, is a key concept in psychology, as yet, developmental psychologists have not found a single agreed framework to define and measure this human trait.

One of the most influential studies of temperament has been the New York Longitudinal Study (NYLS), initiated during the 1950s by Thomas and Chess. They were the first researchers to develop a systematic theory, and they used a nine-dimensional framework for describing children's temperament across a wide age range, from infancy to adolescence. These dimensions represented behavioural aspects such as activity level, adaptability, distractibility (how easily distracted a child is) and attention span.

One of the major difficulties with this framework is that it has not been possible to confirm that these nine dimensions are independent aspects of temperament. Such interdependence is important, because if any two factors are highly correlated, this implies that a single factor could be used instead. In fact, it is likely that there are fewer than nine independent influences on children's behaviour. For example, a child who is very distractible is also likely to have a short attention span.

Thomas and Chess also suggest that as well as separate dimensions, there are distinct types of temperament. Based on the NYLS sample, they suggest that the basic temperament types can be identified early in infancy: the 'easy' child, the 'slow to warm up' child, and the difficult child. In 1968, they presented findings that indicated that children with the difficult style were at increased risk of later behavioural problems.

However, the concept of the difficult temperament type has been the subject of much controversy. It was argued that the concept was primarily a product of the parents' perceptions of their children, rather than differences in the child's actual behaviour. This concern reached its height when Vaughan found that mothers' future ratings of temperament could be reliably identified before the child was born. Vaughan et al (1987) measured aspects of mothers' personalities and attitudes towards child-rearing during their pregnancies and found them to be related to their subsequent ratings of the child's temperament. It was therefore argued that the temperament measure was more influenced by characteristics of the mother than the child.

An alternative theory of temperament was proposed by Buss and Plomin (1984). Partly in response to criticisms of the over-complexity of the Thomas and Chess framework, these researchers developed a simpler system. They were also more strongly influenced by theories of adult personality than were Thomas and Chess.

Reviewed by @bekhruzposts

Buss and Plomin suggested that both experimental laboratory studies and analyses of questionnaire data indicated that there were just three independent temperament dimensions: emotionality, activity and sociability.

In developing their system, Buss and Plomin sought to identify traits that showed early emergence and strong genetic influence, since they considered that these traits are the basis for adult personality. Despite the differences between the two groups of researchers, both see temperamental differences as varying along a continuum.

In contrast, Kagan (1988) emphasises qualitative distinctions. He and his colleagues have been studying children who they regard as belonging to distinct categories, as determined by their response to unfamiliar events and people. On the basis of a systematic series of observations of their behaviour in the laboratory, they suggest that 15 per cent or so of children aged 2-3 years are very shy and timid when faced with the unfamiliar. A roughly equal percentage are uninhibited and socially responsive when confronting unfamiliar people. These two groups show a high degree (75 per cent) of stability into middle childhood, with the children becoming quiet and cautious, and talkative and sociable respectively. This means, for example, that for the substantial majority of children who show extreme shyness in middle childhood, this is not simply a consequence of recent stresses and upsets, but rather a reflection of enduring qualities of their behaviour.

Kagan proposes that very specific sites in the brain, which regulate emotional behaviour and long-term memory, are responsible for differences in behavioural style. He has shown some physiological differences between these groups of children on measures such as heart rate, heart rate variability and pupil dilation. These are all features which indicate the degree of the child's emotional reactions to experiences.

Dunn and Kendrick (1982) have offered an alternative model for the nature of temperamental differences. They found that most children showed some behavioural reaction to the arrival in the family of a new baby, such as disturbed sleep, increased demands for attention, and more tearfulness, and that differences in the intensity of these reactions were related to temperamental characteristics of the children, as measured before the new sibling was born. They also found that temperamental differences were related to differences in the quality of the interaction between the mother and the older child.

Dunn and Kendrick emphasised that children's behaviour is not independent of the situations in which they find themselves. They suggest that the behavioural style that a child will show in a particular setting is partly a property of the relationship between the child and the other person. To the extent that this relationship is stable, so then will the temperamental differences be stable. Using this explanation, it can be seen that the

Reviewed by @bekhruzposts

continuing action of genetic effects on behaviour is not the only mechanism that can produce stable individual differences in behaviour. It is important that theories of temperament consider the child's behaviour in a social context and not in isolation.

Questions 27–29

Choose the correct letter, **A**, **B**, **C** *or* **D**.

27 What does the writer say about the study of temperament in psychology?

A Researchers agree on how to define it.
B It is a relatively unimportant area of study.
C There is no single agreed way to measure it.
D It has only recently become a research topic.

28 What was distinctive about Thomas and Chess's approach in the New York Longitudinal Study?

A They studied only very young infants.
B They used a nine-dimensional framework covering a wide age range.
C They focused solely on genetic causes of temperament.
D They rejected all earlier theories completely.

29 According to the passage, what did Thomas and Chess find regarding children with a 'difficult' temperament type?

A They were more likely to have behavioural problems later in life.
B They usually became 'easy' children as they grew older.
C They were rare among the children studied.
D Their temperament type could be identified only in adolescence.

Reading Passage 1

A Brief History of Humans and Food

During the journey from our hunter-gatherer ancestors to the present day there have been three seismic changes that have had an impact on the food we eat: the discovery of cooking, the emergence of agriculture and the invention of methods of preserving food.

The 19th-century scientist Charles Darwin thought that cooking, after language, was the greatest discovery made by man. All of us eat some raw food, for instance fruit and vegetables, but the great majority of food we eat is cooked. Cooking can turn plants that are inedible into edible food by destroying toxic chemicals that plants often manufacture to protect themselves against attack by insects or other herbivorous animals. These toxic chemicals are referred to as 'plant secondary compounds', because they are not directly involved in the plant's normal growth, development and reproduction, and are produced purely as chemical defences. They give many of the plants we consume, such as coffee or brussels sprouts, their bitter taste.

Cooked food is often more digestible, because heat breaks down tough cellulose cell walls in plants or tough connective tissue in animals. Chewing raw turnip, a plate of uncooked rice, or a raw leg of lamb is much harder work than eating the cooked equivalent. The energy expended in chewing to break down the tough material is replaced by energy from the fuel that is used in cooking the food, so the ratio of energy gained to energy expended by the body is greater when food is cooked.

Until the development of agriculture, hunter-gatherers spent up to seven hours a day gathering food. This all began to change around 10,500 years ago with the advent of farming, which led to some dramatic changes in human societies. People began to create a variety of new tools to help with survival, and in turn populations increased in size. These changes led to the possibility of specialisation of different tasks within society. It was around this time that writing became more sophisticated and allowed people to maintain records of the harvest and taxes. Eventually, formalised structures of government were established as people settled in one area.

The arrival of agriculture meant that, for the first time, our ancestors had more food than they could eat immediately. This, combined with the seasonality of production, led them to discover methods of preserving food: smoking, drying, adding acid by fermentation or

Reviewed by @bekhruzposts

adding salt. These four methods all share one feature in common: they make the food a more hostile environment for bacteria that can cause it to spoil. They also tend to slow down any natural chemical reactions in the food that would cause decay.

Although foods today are still preserved in the ancient ways, two more recent methods of preserving food have become more common: canning and freezing. Canning was invented by a Frenchman, Nicholas Appert, in the early-19th century. He sealed food in bottles fabricated from glass and then heated them in boiling water to cook the contents. Appert's method had great advantages over older methods of food preservation: it could be applied to a wide range of foods, and the flavour of the food as well as the texture were similar to the freshly cooked product. His idea was soon copied by Englishman, Peter Durand. Until this point containers had weighed too much to be widely used, but he produced the first ones which were light and resistant to damage. Two years later, in 1812, two Englishmen, Bryan Donkin and John Hall, started the commercial canning of food, although the real take-off in popularity of canning had to wait until the can opener was invented in 1855. Up to this time, cans were opened with a chisel which was used to break open the top when hit with a hammer. Canning is an extremely effective way of preserving food: one can which contained meat dating from 1824 was opened in 1939 and the contents were still in good condition.

In the 21st century, the dominance of canning as a method of food preservation has been overtaken by another technology: freezing. Chilling food to keep it fresh is an old idea. The earliest mentions of icehouses, thick-walled buildings, half underground, date back to 1,700BC in northwest Iran. In early 16th-century Italy, water was mixed with chemicals to lower its freezing point to -18 degrees Celsius, and several centuries later frozen fish and other goods were transported by ship from Australia to England. But the modern frozen food industry was started in the 1920s by an American, Clarence Birdseye. While Birdseye was on a fishing trip with the Inuit in the Canadian Arctic, he observed that very rapid freezing creates smaller ice crystals and therefore causes less damage to food. This was something he had not expected. Nevertheless, the big growth in demand for frozen food came about with the arrival of freezers in the homes of ordinary people. The advantages of frozen over canned food include the fact that the flavour and consistency are often identical to the equivalent fresh product, and that freezing can be used to preserve a huge variety of foods.

Reading Passage 2

Why Do We Need the Arts?

A Imagine a world in which people spend hours working in offices or factories, and then go home in the evening to sit down to dinner, after which they sleep until it's time to get up and work again. In this world, people do not read or watch TV, listen to music, play computer games or have pictures to decorate their homes. In fact, there are no pictures in this world, not even advertisements are illustrated, but all are words, and very plain ones at that, with no playfulness left in them. The buildings are completely functional without a single decorative feature anywhere, and there is no music to dance to and enjoy. Such a world is a world without the arts in any form.

B To ask what the arts are good for is not exactly the same as asking what their purpose is. The arts do not have to have a purpose, they do not exist in order to teach, to make a moral point, to entertain, to distract, to amuse, to support a revolution, to disgust, to challenge, to stimulate or to cheer; they exist chiefly for their own sake. It is artists, not the arts as such, that may have an aim in mind, and their aim may be to do any of the things just listed. But equally, artists may just make a work of art because they feel compelled to. Because the work is its own justification, no aim or goal is necessarily required to explain or, still less, to justify its existence.

C But to say that the arts do not have to serve an aim beyond themselves, even though they may sometimes do so, is not to say that they are good for nothing. On the contrary, as such an important part of human experience, they are good for many things. The distinction here lies between things that are instrumental and things that are ends in themselves. An instrument exists for something beyond itself, namely, for what it can be used to do. We know that pictures are used as instruments in advertising, and the objective is always to persuade us to buy something. Similarly, music can be written chiefly to accompany dancing, or as a soundtrack to a movie. A play can be written to point out to the theatre audience a social injustice or other problems that should be dealt with. But even though the arts can sometimes be instrumental, that fact is not essential to their nature. What the arts are 'good for' arises from their being an end in themselves, or more accurately, representing many different things that are valuable for their own sakes, such as, for instance, the creation of beauty.

D The phrase 'the arts' includes painting, sculpture, music, literature, dance and theatre performance, and whatever else (to quote the famous US artist Andy Warhol) anyone can get away with in calling their creation a contribution to 'the arts'. But the generalisation that the arts, whatever else they are, are always an end in themselves, applies to them all. The arts are one major form of response to the world. They are often an attempt to capture

Reviewed by @bekhruzposts

an aspect of the world, to draw attention to something about it to comment on it, to present a surprising or fresh angle on it, to represent it for the sake of exploring something about it, or enjoying or celebrating it. They can help people to focus on, for example, the colour or shape of an object, its eccentricity or typicality, and the interest or perhaps disgust it provokes in them.

E For a loose comparison, think of laughing at a joke. We do not laugh so that we can achieve a further goal, in order to be healthy or relaxed, say, even if we thereby succeed in being healthier or more relaxed, but simply because the joke has elicited that reaction. But although it is merely a reaction, laughing is, in fact, good for something nevertheless; it does make people feel better. The arts are a reaction in the same way. French artist Cézanne painted Mont Sainte-Victoire repeatedly because he was fascinated by it, not because he thought that painting it would say something about politics or society or human hopes. Being fascinated by something, attracted to it, repelled by it, keen to reveal an unusual aspect of it, are all responses to that thing; the making of the arts is one outstanding way of expressing such responses.

F But the arts are a response not only to things in the world but also to experience of the world, which lies inside the artist himself. And they are also often an expression of what presses from within the artist without being elicited by externals. Music is a prime example. A symphony, unless it is devised to represent bird song, rain, the sea and the like, is an abstract expression of a composer's conception. We may be able to describe what the Russian composer Tchaikovsky is doing in his ballet music, but how can we describe what he is expressing in his piano concertos? Composers may experiment with melody and rhythm in very abstract, sometimes mathematical, ways.

G When artists get to work responding to and expressing ideas, whether or not they also want to make a point, entertain, distract, support a revolution and the rest, they are producing something that someone else will react to in some way. They seek to connect with their audience and express an idea or emotion which has the capacity to enrich our experience of life itself.

Reading Passage 3

The Significant Role of Mother Tongue Language in Education

One consequence of population mobility is an increasing diversity within schools. To illustrate, in the city of Toronto in Canada, 58% of kindergarten pupils come from homes where English is not the language of communication. Schools in Europe and North America have experienced this diversity for years, but educational policies and practices vary widely between countries and even within countries. Some political parties and groups search for ways to 'solve the problem' of diverse communities and their integration in schools and society. They see few positive consequences for the host society and worry that diversity threatens the identity of the host society. Consequently, they promote unfortunate educational policies that will make the 'problem' disappear. If students retain their culture and language, they are viewed as less capable of identifying with the mainstream culture and learning the mainstream language of the society.

The challenge for educators and policy-makers is to shape the evolution of national identity in such a way that the rights of all citizens (including school children) are respected, and the cultural, linguistic and economic resources of the nation are maximized. To waste the resources of the nation by discouraging children from developing their mother tongues is quite simply unintelligent from the point of view of national self-interest. A first step in providing an appropriate education for culturally and linguistically diverse children is to examine what the existing research says about the role of children's mother tongues in their educational development.

In fact, the research is very clear. When children continue to develop their abilities in two or more languages throughout primary school, they gain a deeper understanding of language and how to use it effectively. They have more practice in processing language, especially when they develop literacy in both. More than 150 research studies conducted during the past 35 years strongly support what Goethe, the famous eighteenth-century German philosopher, once said: that the person who knows only one language does not truly know that language. Research suggests that bilingual children may also develop more flexibility in their thinking as a result of processing information through two different languages.

Children who come to school with a solid foundation in their mother tongue develop stronger literacy abilities in the school language. When parents and other caregivers (e.g. grandparents) are able to spend time with their children and tell stories or discuss issues with them in a way that develops their mother tongue, children come to school well-prepared to learn the school language and succeed educationally. Children's knowledge

Reviewed by @bekhruzposts

and skills transfer across languages from the mother tongue to the school language. Transfer across languages can be two-way: both languages nurture each other when the educational environment permits children access to both languages.

Some educators and parents are suspicious of mother tongue-based teaching programs because they worry that they take time away from the majority language. For example, in a bilingual program where 50% of the time is spent teaching through children's home language and 50% through the majority language, surely children won't progress as far in the latter? One of the most strongly established findings of educational research, however, is that well-implemented bilingual programs can promote literacy and subject-matter knowledge in a minority language without any negative effects on children's development in the majority language. Within Europe, the Foyer program in Belgium, which develops children's speaking and literacy abilities in three languages (their mother tongue, Dutch and French), most clearly illustrates the benefits of bilingual and trilingual education (see Cummins, 2000).

It is easy to understand how this happens. When children are learning through a minority language, they are learning concepts and intellectual skills too. Pupils who know how to tell the time in their mother tongue understand the concept of telling time. In order to tell time in the majority language they do not need to re-learn the concept. Similarly, at more advanced stages, there is transfer across languages in other skills, such as knowing how to distinguish the main idea from the supporting details of a written passage or story, and distinguishing fact from opinion. Studies of secondary school pupils are providing interesting findings in this area, and it would be worth extending this research.

Many people marvel at how quickly bilingual children seem to 'pick up' conversational skills in the majority language at school (although it takes much longer for them to catch up with native speakers in academic language skills). However, educators are often much less aware of how quickly children can lose their ability to use their mother tongue, even in the home context. The extent and rapidity of language loss will vary according to the concentration of families from a particular linguistic group in the neighborhood. Where the mother tongue is used extensively in the community, then language loss among young children will be less. However, where language communities are not concentrated in particular neighborhoods, children can lose their ability to communicate in their mother tongue within two to three years of starting school. They may retain receptive skills in the language but they will use the majority language in speaking with their peers and siblings and in responding to their parents. By the time children become adolescents, the linguistic division between parents and children has become an emotional chasm. Pupils frequently become alienated from the cultures of both home and school, with predictable results.

Questions 27–30

Choose the correct letter, **A**, **B**, **C** *or* **D**.

27 What point is the writer making in the second paragraph?

A Some present studies on children's mother tongues are misleading.

B A culturally rich education programme benefits some children more than others.

C Bilingual children can make a valuable contribution to the wealth of a country.

D The law on mother tongue use at school should be strengthened.

28 Why does the writer refer to something that Goethe said?

A to lend weight to his argument

B to contradict some research

C to introduce a new concept

D to update current thinking

29 The writer believes that when young children have a firm grasp of their mother tongue

A they can teach older family members what they learn at school.

B they go on to do much better throughout their time at school.

C they can read stories about their cultural background.

D they develop stronger relationships with their family than with their peers.

30 Why are some people suspicious about mother tongue-based teaching programmes?

A They worry that children will be slow to learn to read in either language.

B They think that children will confuse words in the two languages.

C They believe that the programmes will make children less interested in their lessons.

D They fear that the programmes will use up valuable time in the school day.

B school
C dislocation
D rate
E time
F family
G communication
H type
I ability
J area

Bilingual children

It has often been noted that bilingual children acquire the (31) ———— to converse in the majority language remarkably quickly. The fact that the mother tongue can disappear at a similar (32) ———— is less well understood. This phenomenon depends to a certain extent on the proportion of people with the same linguistic background that have settled in a particular (33) ————. If this is limited, children are likely to lose the active use of their mother tongue, and thus no longer employ it even with (34) ————, although they may still understand it. It follows that teenage children in these circumstances experience a sense of (35) ———— in relation to all aspects of their lives.

1. FALSE

QUESTION KEYWORD	Chillz packaging unattractive
PASSAGE EVIDENCE	"it looks as if it has been carved from ice. This simple feature means shoppers are **drawn to this bottle**"

2. NOT GIVEN

QUESTION KEYWORD	TV vs internet exposure amounts
PASSAGE EVIDENCE	The passage lists shopping, internet and TV together as sources of "one [message] every 15 seconds," without comparing them.

3. TRUE

QUESTION KEYWORD	why most products die (Rayner)
PASSAGE EVIDENCE	"Nine out of 10 new products meet an early death... the reason... is simple: **conventional advertising has ceased to work**"

4. TRUE

QUESTION KEYWORD	no longer influenced by traditional ads
PASSAGE EVIDENCE	"most of the advertisements made no impression at all: only about **one per cent could be recalled** without prompting"

5. NOT GIVEN

QUESTION KEYWORD	Jamie Rayner on simpler commercials
PASSAGE EVIDENCE	The "keep it simple" advice ("deliver your message... slowly, gently and concisely") is attributed to **Raymond**, not Rayner — the passage does not report this view from Rayner.

6. NOT GIVEN

QUESTION KEYWORD	unfamiliar vs familiar brand distraction
PASSAGE EVIDENCE	The distraction research ("if people are distracted... they tend to instantly dislike the brands") never compares unfamiliar and familiar brands.
